## EXECUTIVE SUMMARY

This regulatory evaluation examines the impacts of a proposed rule to amend parts 121, 129, and 135 of Title 14 of the Code of Federal Regulations (14 CFR). The proposed rule would require all airplanes operated under part 121, all U.S. registered airplanes used in scheduled passenger carrying operations under part 129, and all multiengine airplanes used in scheduled passenger carrying operations conducted under part 135 to include a Federal Aviation Administration (FAA) approved corrosion prevention and control program (CPCP) in the airplane's maintenance or inspection program.

Over the twenty-year study period of this analysis, the proposed CPCP operating requirement for existing certification models is projected to cost \$80.0 million to the industry and \$221 thousand to the FAA (all costs in present value.) For newly type certificated models, the proposed rule is projected to cost \$534 thousand to the industry and \$30 thousand to the FAA. Based upon an independent risk analysis of over 1,500 National Transportation Safety Board accidents and conservative risk assessment results in a forecast of a range between 25 to 50 corrosion-induced accidents over a twenty-year period. Under the assumption that these accidents are uniformly distributed, then the present value of these safety benefits range from \$72.5 million to \$145.0 million. The FAA does not intend to wait for a series of accidents to provide justification for this proposed rule. The FAA needs the corrosion prevention and control program to assure the continued airworthiness of the affected fleet. In addition to the safety benefits of the proposed rule, a short extension of the existing life of the fleet subject to this rule exceeds the cost of this proposed rule. This rule extends to a significant number of airplanes the corrosion prevention and control program found to be necessary for in-service commercial jet airplanes based on studies following the Aloha Boeing 737 accident. The FAA concludes that the benefits of this proposed rule justify the costs.

The FAA has made initial determinations that the proposed amendment: (1) would have a significant economic impact on a substantial number of small entities, (2) would not constitute a barrier to international trade, and (3) would not constitute an unfunded mandate.

## Corrosion Prevention and Control Program

### I. Introduction

This regulatory evaluation examines the impacts of a proposed rule to amend parts 121, 129, and 135 of Title 14 of the Code of Federal Regulations (14 CFR). The proposed rule would require all airplanes operated under part 121, all U.S. registered airplanes used in scheduled passenger carrying operations under part 129, and all multiengine airplanes used in scheduled passenger carrying operations conducted under part 135 to include a Federal Aviation Administration (FAA) approved corrosion prevention and control program (CPCP) in the airplane's maintenance or inspection program. This action is necessary to control airplane structural material loss and the detrimental effects of corrosion because existing maintenance or inspection programs may not provide comprehensive, systematic corrosion prevention and control.

### II. Background

On April 28, 1988, an in-flight accident occurred when a large transport airplane lost approximately 18 feet of the upper fuselage. The National Transportation Safety Board (NTSB) investigation revealed that the probable cause of this accident was the failure of the operator to detect the presence of skin disbonding, with resulting corrosion and metal fatigue, that ultimately led to the separation of the aircraft's skin and structure. The NTSB observed numerous areas of corrosion on the accident airplane and on other airplanes in the operator's fleet. The NTSB noted that the operator did not have a programmatic approach to corrosion prevention and control. In its accident investigation report (NTSB/AAR-89/03; Recommendation No. A-89-59), the NTSB recommended that the FAA "develop a model program for a comprehensive corrosion prevention and control program (CPCP) to be included in each operator's approved maintenance program."

Prior to 1988, the FAA lacked compelling evidence that existing maintenance and inspection programs were not controlling corrosion to a safe level. Although many airplane manufacturers had provided maintenance programs for corrosion prevention and control, the FAA saw no reason to mandate such programs.

After the 1988 accident, the FAA sponsored an aging fleet conference at which the Air Transport Association of America (ATA) and the Aerospace Industries Association of America (AIA) committed to identifying and implementing procedures to ensure continued structural airworthiness of aging transport category airplanes. As a result, an Airworthiness Assurance Task Force (AATF) was established which included aircraft operators, manufacturers, and regulatory authorities. An immediate objective of the task force was to sponsor airplane model-specific working groups to identify aging fleet structural maintenance requirements. The working groups were tasked to: (1) select service bulletins to be recommended for mandatory implementation; (2) develop baseline corrosion prevention and control programs; (3) review supplemental structural inspection programs; (4) assess repair quality; and (5) review maintenance programs. Task 2 resulted in airworthiness directives that mandated specific corrosion prevention and control programs for the following 11 airplane models: the Airbus A-300, British Aerospace BAC 1-11, Boeing 707/720, 727, 737, and 747, Fokker F-28, Lockheed L-1011, and McDonnell Douglas DC-8, DC-9, and DC-10.

A typical CPCP AD requires the operator to incorporate a baseline CPCP into its maintenance or inspection program. The baseline CPCP consists of corrosion prevention and control tasks, definitions of corrosion levels, compliance times (implementation thresholds and repeat intervals) and reporting requirements. After an operator has incorporated a baseline CPCP into its maintenance or inspection program, the AD's allow adjustment of the CPCP repeat intervals in cases where the maintenance program is controlling corrosion to an acceptable level. The FAA has determined that corrosion damage occurring between successive inspections that is local and can be blended out within allowable limits, is an acceptable level of corrosion.

The FAA is proposing general rulemaking that would mandate CPCP's for a significant number of airplanes used in air transportation. The FAA considered continuing the practice of issuing individual CPCP ADs for each airplane model, but has

decided that a rule of general applicability should be issued instead of waiting for the unsafe conditions that would initiate AD actions for individual models.

### III. Discussion of Costs and Benefits

#### Costs

The primary costs of the proposed rule would be borne by those scheduled operators of multiengine airplanes not currently subject to a mandatory corrosion prevention and control program. Additional costs would also be incurred by manufacturers who participate in the assessment and development of the corrosion programs for the affected airplane models, but this evaluation assumes that all such costs would eventually be passed through to the operators. The FAA itself would incur relatively minor costs for reviewing and approving: (1) the corrosion prevention and control programs, and (2) the incorporation of these new procedures into existing maintenance and inspection programs.

Note that the attributed costs of this proposal do not include the expense of making major repairs or modifications that may be found necessary during the inspections mandated by this proposal. While the FAA recognizes that such repairs may constitute a significant expense, repair costs are not attributed to this proposed rule because existing FAA regulations require that repairs be made as found to be necessary to assure the continued airworthiness of the airplane. The major cost elements of the proposed rule are for development of the CPCP and conducting the actual inspections.

The methodology used in the evaluation first computes the costs that would be incurred if it were economically viable for all of the airplanes in the affected fleet to meet the requirements of the proposed rule. Based on these costs, and their comparison to the approximate fleet value, the methodology later estimates the numbers of airplanes and models where compliance would not actually be economically viable, and where instead, the airplanes would likely be retired from scheduled service.

The CPCP development and implementation costs described in this section are calculated from a 1997 data collection of the potentially affected fleet. The worksheets for these calculations are detailed below and are included in the Appendix as Table 1. Approximately 7,100 airplanes were identified as being subject to the proposed rule and are included in the data set. For the majority of these airplanes, the proposal would not generate any additional costs since the subject airplanes already comply with airworthiness directives that parallel the proposal. Some 2,900 of these airplanes would be affected by the proposal in one manner or another, and as such, would incur costs.

Development cost factors (Table 1, Column E) were estimated for each airplane model group. These factors, ranging from zero to one, represent the proportion of full CPCP development costs that would be incurred for each airplane model group. The factors account for the fact that full compliance programs are in place for some models (factor = 0) and that the development costs for some other models would be reduced (factor less than 1) either due to their similarities to other models, or because some models have partially compliant programs. The factors also account for the fact that airplanes certificated under existing § 25.571, amendment 45 or later, are already required to undergo an evaluation of their strength, detail design, and fabrication to show that failure due to corrosion will be avoided throughout the operational life of the airplane.<sup>1</sup> For these newer models, development factors of .1 were assigned to represent the estimated additional effort (equal to one-tenth of a completely incremental CPCP evaluation and development) that would be necessary to comply with the proposed rule. Taken together, the various cost factors produce an estimated cost equivalence of approximately 47 full CPCP development efforts among the 88 model groups that were identified.

As input to later calculations, described below, data were collected and aggregated measuring the average weight and average year of manufacture for the airplanes in each model group (Table 1,

---

<sup>1</sup> Similar requirements exist under § 23.573(b) for commuter category airplanes and § 23.574 for composite materials airplanes, but none of the airplanes in this evaluation were certificated under the latest amendments to these regulations.

Columns B and C). Column F estimates the number of hours that would be necessary to develop the CPCP for each model. The cost methodology employs a three step functional estimate of the time needed to develop each CPCP. First, the nominal number of development hours is estimated as a function of the average maximum takeoff weight (MTOW) for each model.

$$\text{Eq. 1.} \qquad \text{Hours} = 2,296 + (.04 \times \text{MTOW})$$

This equation was derived from a two-point linear plot of the estimated costs expended to develop the CPCP for two existing airplane models (the DC-9 and the Piper Navajo). The results of the Eq. 1 estimates were then multiplied by the development factors (from Column E) to account for the reduced development efforts for similar or partially compliant models described above. Finally, a third factor (calculated in Column M and described below) was applied to account for the possibility that a CPCP would not be developed for an airplane model where it was reasonably expected that the airplanes in that model would have been retired before the effective period of the proposed rule.

The hours for development were converted into cost estimates (Column G) for each model by applying a fully burdened engineering cost rate of \$95 per hour for CPCP development. This produced a cost per model ranging between \$32,000 and \$427,000 (for the non-zero development cases.) The estimated development cost for all models sums to \$10.4 million, or \$7.9 million expressed in present value terms.

Column H estimates the FAA's costs to review and approve the CPCP's described above. The evaluation employs a straight factor of 80 hours of review per newly developed CPCP, at a burdened cost rate of \$55 per hour. These factors produce estimated costs of \$4,400 per model, and \$246,400 for the affected fleet, or in present value \$141,171.

Similar to the "development" cost factors described above, Column I contains the "implementation" cost factors for each model. The implementation factors also range between zero and one, and

constitute the expected proportions of full incremental implementation effort that would be caused by the proposal for each model. In addition to accounting for the existence of fully or partially compliant CPCP's themselves, the implementation factors also account for those cases whereby an industry developed CPCP may exist for a given airplane model, but its implementation is either not currently mandated by FAA direction, or where the associated work level would be increased by this proposal. The evaluation projects the work load equivalence of 60 full incremental implementations within the 88 affected model groups.

The first stage of implementation for the proposed rule would be incorporating the model-specific CPCP into an operator's maintenance or inspection program. The resource data set described above was cross-tabulated to determine the distribution and number of unique combinations of operators and subject airplane models to estimate the number of new CPCP's that would need to be incorporated into existing operator programs (487 operator-model combinations were found.) These results are shown in Column J. In turn, Column K calculates the expected cost of these CPCP incorporations for the operators of each model by multiplying the number of operator-model combinations in Column J, by an estimated 40 hours incremental work per incorporated program, and by a unit labor rate of \$55 per hour. The total expected cost of this work, across all operator-model combinations, sums to \$609,400, or \$434,494 in present value.

Similar to their review of the actual CPCP's, FAA personnel would also need to review and approve the incorporation of the CPCP's into the existing maintenance and inspection programs of the operators. The calculation of these costs parallels the operator cost calculation from above with the exception that only 8 hours of review work would be necessary per incorporation. These "second" FAA review costs are shown in Column L and sum to \$121,880, or \$78,683 in present value.

Next, the calculation of the actual operator inspection activities that would result from the CPCP's are computed, starting in Column M. The evaluation assumes that the proposed rule would

become final at the end of the year 2000, that the required new CPCP's would be developed by the end of the year 2002, and that inspections and maintenance, where scheduled, would start in the year 2003. The evaluation uses a 20-year study period (from the effective date of the rule) and, therefore, assesses expected costs through the year 2020. The inspections for any particular airplane would not begin before the time specified in the CPCP for that model, and the initiation of work under the CPCP's would vary by airplane model and by individual airplane structure. This evaluation assumes that the preponderance of corrosion related inspection and maintenance work under the proposed rule would begin in the tenth year of an airplane's operation. The evaluation further assumes that the airplanes under this proposal would not be retired from service until age 35. Implicitly, this exaggerated average service carries the assumption that the distribution of sizes, ages, and numbers of airplanes in the future would be similar to the present fleet. The evaluation simplifies the cost calculation by assuming that the fleet remains essentially constant over the effective duration of the study period, as opposed to making explicit fleet retirement and replacement assumptions by model.

Using the four parameters described above, Column M estimates the projected number of years that inspections under this proposal would be conducted within the study period. For each airplane model, this period is calculated as the intersection of: (1) the years included within the study period, and (2) the years where the average age of the affected airplanes would be between 10 and 35 years old. Similarly, Column N computes the median year of the inspection period under the proposal for each airplane model. This information is used later in the calculations to estimate the time-dependent present value of the inspection costs.

The projected, average number of years that each model would be inspected under the program (from Column M above) multiplied by the number of affected airplanes in each model (Column O) produces the expected airplane-years of program coverage under the proposal, by model. This figure, in turn, is multiplied by the projected number of hours of work per year (Column Q) that the CPCP would

require, and by the cost of labor per hour for that work, to produce the estimated cost of implementation. The assumed unit cost rate is \$55 per hour. The projected annual number of work hours for each airplane under the proposal is computed as a function of airplane size (maximum takeoff weight).

$$\text{Eq. 2.} \qquad \text{Hours} = 88 + (.0006 \times \text{MTOW})$$

This functional estimate was derived from a linear regression ( $r^2 = .58$ ) of the airplane weights and the annual work-hour projections included in 13 CPCP airworthiness directives (the original eleven plus two subsequent directives for the Casa C-212 and the Fokker F-27) mandating industry developed corrosion programs. The "hours per airplane per year" results of Column Q are the product of the functional estimate in Equation 2, above, multiplied by the implementation factors from Column I. Finally, the projected inspection costs over the study period are shown in Column R. These costs were computed as the product of: (1) Column P, the numbers of airplane-years of coverage under the program, (2) Column Q, the work hours per airplane per year, (3) a unit cost factor of \$55 per hour for the inspection and maintenance work, and (4) a factor of 1.2 to account for the 20 percent overhead of record keeping and paperwork. These computations forecast a total of \$155 million in inspection costs (\$64.5 million in present value) through the year 2020.

In addition to the actual costs of inspecting the airplanes, costs can also be attributed to the incremental downtime that would be necessitated by the work required under the proposal. The evaluation assumes that each 40 hours of work necessitated by the CPCP requirement would require 1 additional day of airplane downtime. The projected additional down-days are computed in Column S as the product of: (1) Column P - the number airplane years in the program, (2) Column Q - the work hours per airplane per year, and (3) the assumed unit factor of 1 down day per 40 hours of added work. Under these assumptions, the evaluation projects 58,658 days of additional downtime for the affected fleet throughout the twenty-year study period as a result of the work attributed to the proposal.

The economic valuation of this downtime was computed under the assumption that the average productive return on capital is equal to 7 percent of the value of that capital, per year. Accordingly, the downtime costs were calculated as the product of: (1) the number of additional downtime days, from Column S, divided by 365 days per year, (2) the estimated economic value of the fleet for each model, from Column T, calculated at the median program year for that model, from Column N, and (3) the 7 percent per year assumed rate of return on capital. These costs are detailed in Column U, and they total \$21.5 million, or in terms of present value \$8.6 million.

Columns V through Y compute the present values (7 percent discount rate) of the four component costs of the proposal to the industry. For computational expediency, the present value calculations assume that all development costs occur in the year 2002, operator incorporation costs occur in the year 2003, and both the inspection and downtime costs occur in the median year of the inspection program for each model. The four component present-value costs are combined in Column Z to estimate the present value of the total expected cost of the proposed rule to industry (\$81.5 million, not including the FAA review costs described earlier.)

| <u>Present Value Cost To The Industry</u> |                 |                   |                 |              |
|---|-----------------|-------------------|-----------------|--------------|
| <u>Development</u>                        | <u>Operator</u> | <u>Inspection</u> | <u>Downtime</u> | <u>Total</u> |
| <u>Cost</u>                               | <u>Cost</u>     | <u>Cost</u>       | <u>Cost</u>     | <u>Cost</u>  |
| \$7,913,985                               | \$ 434,494      | \$64,524,942      | \$8,626,515     | \$81,499,936 |

As noted in the introductory remarks of the cost section, the calculations described above assume that all of the subject airplanes would comply with the CPCP requirements of the proposed rule. At this point, however, the evaluation recognizes that it may not, in fact, be economical to develop and implement a CPCP for some older airplane models with very few subject airplanes. In order to account for this possibility, the evaluation compares the expected industry costs of the rule, computed for each model in Column Z, with the estimated fleet values of the affected models in Column AB. Column AC tests whether the expected CPCP program costs would exceed 50 percent of the value of the airplane fleet for each

model. In the 11 cases where the program costs are projected to be prohibitive for that model, the expected compliance costs for the model are removed from the program implementation costs in Column AE, and instead, a reduction of 50 percent of the value of the airplanes in that model is assigned as the attributed cost of the proposed rule for that model. Under this scenario, the present value costs to industry of the proposed rule would consist of \$78.7 million in implementation costs and \$1.3 million in costs resulting from reductions in airplane value due to a forecast economic inability to comply with the proposal. These two costs are merged in Column AG to constitute the total \$80.0 million present-value cost of the proposed requirement to industry. Finally, Column AH shows the present value of the FAA costs for review, \$220,885, computed previously in Columns H and L.

In addition to the proposed requirements for existing airplane models, the proposal would also require baseline corrosion prevention and control programs for future, newly certificated airplane models that would likely be marketed for scheduled passenger operations. These relatively lower costs are estimated and described in Table 2 of the Appendix. The projection of the numbers and sizes of future airplane certifications, particularly in the out years, is very speculative. As such, Table 2 is intended to be representative rather than predictive, and readers are encouraged to make adjustments in the estimations in line with their own predictions.

For the purpose of example, Table 2 shows one new certification per year between the effective date of the proposed rule and the end of the evaluation study period. In order to represent the likely sizes of the airplanes that might be certificated, the existing airplane models evaluated above were sorted by their maximum takeoff weights, and were grouped into 18 classifications. The average weight of the airplanes in each of these 18 classes was then computed to represent the likely size of airplanes that would be certificated in each of the 18 years of the study period. In an effort to remove the bias of the order in which the various size airplanes were presumed to be certificated over time, the 18 airplane weight classes were assigned randomly

across the 18 study years.

As noted previously, the existing certification standards for all part 25 models and for certain part 23 models (commuter category and composite materials airplanes) require that future airplane models undergo an evaluation of their strength, detail design, and fabrication to show that failure due to corrosion will be avoided throughout the operational life of the airplane. As previously described, a development factor of .1 was assigned to the existing airplane models that were certificated to these standards, and in a parallel fashion, one-tenth of a full development cost is also assigned to the affected future airplane models. It should be noted that the existing certification procedures that would cause this reduced incremental impact are not required for metallic (non-composite material) airplanes in the normal, utility, or acrobatic categories for part 23. The evaluation assigns to these airplanes (weighing 12,500 pounds or less) a CPCP factor of .5, which recognizes that: (1) in the absence of this rule, these airplanes would not be substantially compliant with a CPCP requirement, but (2) substantial savings (one-half) in CPCP development would be realized as the development of the corrosion program would be included in the development of the airplane itself, rather than being retroactively considered for an existing model.

The evaluation also recognizes that not all future airplane models will likely be marketed or used for scheduled passenger operations. In the absence of model-specific information, the evaluation assumes that future models under 6,000 pounds (2 of the 18 models considered here) would not incur additional costs as a result of this rule.

Returning to the computations in Table 2, Column C calculates the estimated hours necessary to develop a CPCP for each airplane model in the example forecast. For the non-zero cases, the same formula that was used above (Eq 1:  $\text{Hours} = 2,296 + (.04 \times \text{MTOW})$ ) was also applied here, with the result being multiplied by a factor of either .1 or .5 depending, respectively, on whether the airplane model was above or below 12,500 pounds. Again, parallel to the

previous computations, the development costs are computed in Column D by multiplying the expected development hours by an engineering labor rate of \$95 per hour. Similarly, the expected FAA review costs were computed as 80 hours of review per CPCP, multiplied by a unit labor factor of \$55 per hour. Finally, the industry and FAA costs are combined in Column F (total \$1.3 million) and the annual present values of these costs are computed and summed (\$563,835) in Column G.<sup>2</sup>

In summary, over the twenty-year study period of this analysis, the proposed CPCP operating requirement for existing certification models is projected to cost \$80.0 million to the industry and \$221 thousand to the FAA (all costs in present value.) For newly type certificated models, the proposed rule is projected to cost \$534 thousand to the industry and \$30 thousand to the FAA.

#### Description of Benefits

The purpose of this rulemaking is to assure that corrosion does not degrade the airworthiness of affected air carrier airplanes. The corrosion prevention and control program contained in this proposal originates, in part, from the recommendations following the investigations of the Aloha Boeing 737-200 accident on April 28, 1988 when 18 feet of upper fuselage separated from the airplane in flight. The National Transportation Safety Board determined the probable cause of that accident was that corrosion and metal fatigue led to separation of the airplane's skin and structure.

All metal airframe structures are vulnerable to corrosion and older aircraft are much more likely to experience corrosion than newer airplanes. Corrosion is a natural process and occurs because of the tendency of metals over time to return to their original state. Maintenance and inspection records reveal that the presence of corrosion is more prevalent and pervasive in older aircraft. A review of the annual total of the number of listings in the Service Difficulty Reports involving corrosion over a subset of U.S. commercial airplanes provides a sense of the magnitude of the

---

<sup>2</sup> This evaluation does not address the "inspection" portion of the costs that would result for these future models since, within the study period, very few airplanes would be certificated, produced, and then age to the point where the inspections from a CPCP would be prevalent. Furthermore, the

problem.

---

present values of these few, out-year expenses would be negligible relative to the other costs of this proposal..

| <b>Total</b>  | <b>4048</b>        | <b>3021</b> | <b>5125</b> | <b>5142</b> | <b>5193</b> | <b>5187</b> | <b>5280</b> | <b>6323</b> |

The problem of corrosion is that it is both prevalent and destructive. Multiple Site Damage (MSD) is an undesirable condition caused by wide spread cracking of an airplane structure. R. Plelloux, et al in "Fractographic Analysis of Initiation and Growth of Fatigue Cracks at Rivet Holes writes "In the case of MSD, fatigue cracks are reported to initiate at rivet holes in the fuselage lap joints after the epoxy bond failed as a result of corrosion in high humidity environments ... the cracks grow to a length of approximately 6 to 8 mm (.25 inches to .30 inches) on each side of the rivet, before fracture by tensile instability. Note that rivets (on the airplane skin) are spaced an inch apart center to center. Crack growth in service has been reported to occur over 20,000 to 40,000 cycles." Thus corrosion can cause multiple cracks around a rivet. When the cracks reach a length of .25 to .3 inches fracture by tensile instability occurs. Cracks have been reported in aircraft with much fewer cycles than those recently upgraded from Stage 2 to Stage 3 standards in the last ten years.

Corrosion's detrimental effects are not limited to rivet holes. Corrosion decreases the size of structural members and can also have bad synergisms with factors leading to early cracking. When a fatigue crack reaches a corroded section the growth rate of the crack increases by a factor of 3 (J.P. Chubb, et al, "The Effect of Exfoliation Corrosion on the Fatigue Behavior of Structural Aluminum Alloys"). The NTSB report to the FAA on the Aloha Boeing 737 accident cited finding corrosion in the throttle

cables (in the leading edge). When the appropriate cable sections were removed from the aircraft and inspected there were indications of corrosion and this corrosion likely weakened the cables so that they separated at lower than design load. Corrosion was present for the entire length of that portion of the cable routed through the leading edge.

Since different sources may use slightly different definitions, for clarity, several important definitions are now identified. The definition of multiple site damage is a source of widespread fatigue damage characterized by the simultaneous presence of fatigue cracks in the same structural element (i.e., fatigue cracks that may coalesce with or without other damage leading to a loss of required residual strength). Widespread fatigue damage (WFD) in a structure is characterized by the simultaneous presence of cracks at multiple structural details that are of sufficient size and density whereby the structure will no longer meet its damage tolerance requirement (i.e., to maintain its required residual strength after partial structural failure). Multiple element damage (MED) is a source of widespread fatigue damage characterized by the simultaneous presence of fatigue cracks in similar adjacent structural elements.

The Boeing 737 lap splice design originally required a good bond for load transfer. Environmental degradation caused the bond to deteriorate to the point where all of the load transfer ended up transferred through the fasteners, which were never designed to take that load. MED can also result from corrosive environments as well.

#### Benefits - A Risk Assessment

The FAA employed GRA<sup>3</sup>, Inc. to provide a risk assessment to help make determinations regarding the likelihood of aviation accidents related to corrosion. Under this contract, GRA qualitatively identified and characterized the types of potential corrosion hazards faced by aircraft and developed a method to assign quantitative risk evaluation.

For their analysis, GRA relied upon the National

---

<sup>3</sup> "CORROSION PREVENTION AND CONTROL RISK ANALYSIS", FAA Contract No. DTFA01-93-C-00066, Work Order 52, Prepared by GRA, Incorporated, May 12, 1999. A copy of this document is filed in the docket.

Transportation Safety Board (NTSB) Aviation/Incident Database. The NTSB database contains detailed information on over 37,000 accidents that have been catalogued since 1985; it includes a "sequence of events" history for each accident that describes the events leading up to an accident. A broad search of the 37,000 NTSB accidents resulted in a total of 1,551 accidents that were examined in detail.

The FAA Incident Data System (AIDS) was used to help assess the impacts of the Airworthiness Directives issued in the early 1990's. The FAA Service Difficulty Reporting System (SDRS) assisted by providing information assessing the incident and severity of the corrosion problem, as well as information of the effectiveness of current safety programs. GRA found it difficult to link incident and service difficulty reports with observed or anticipated changes in accident or incident rates. As a result, GRA took a conservative approach by not attempting to quantify benefits using either AIDS or SDRS.

The methodology employed by GRA is known as "event tree" analysis. Event tree analysis is used to characterize a chain of events leading to accidents under a variety of circumstances. This methodology has been used successfully in other environments where, as with aircraft, the probabilities of occurrence are very small.

Event trees are defined by:

- An initiating event
- A further chain of events related to "safety functions", which represent aircraft system responses or operator actions when a particular event occurs
- A terminating event
- Estimation of success and failure probabilities at relevant nodes in the event tree

An event tree should define a comprehensive set of accident sequences that encompass the effects of all possible accidents involving the aircraft. These trees begin with the initiating event, or the starting point. Following the initiating event, the set of events related to safety functions, which end with the terminating, event is specified. With the event tree constructed information from the NTSB, 1,551 accidents were used to populate (provide probability estimates) the tree.

Event trees with corrosion-induced initiating events were defined based on these records for the following ten aircraft systems:

- Flight control surfaces/attachments
- Flight control system-internal
- Landing gear
- Fuselage forward
- Fuselage center
- Fuselage aft
- Fuel system
- Nacelle/Pylons
- Engines
- Electrical systems and wiring

The subsequent events, which occur after the initiating event, were defined with the following generic sequence:

- Operator error in addressing/mitigating the initiating event
- Failure of operator to recover after initial failure to address/mitigate
- Failure of flight control function
- Failure of operator to recover flight control function
- Failure of landing gear during take-off or landing
- Failure of operator to recover landing gear function

Beginning with the initiating event probability, each subsequent event probability is multiplied across each branch. The multiplication of events along each branch results in the probability of an outcome (or terminating event). Summing the terminating event probabilities, which end in damage, equals the probability of a corrosion-related accident by aircraft system. GRA's Table 2 with the estimated corrosion-related accident rates by aircraft system is reproduced below.

| Estimated Corrosion-Related Accident Rates by Aircraft System |                               |
|---|-------------------------------|
| Aircraft System   | Rate per 1,000,000 Operations |
| 1. Flight Control Attachments                                 | 6.53 E-02                     |
| 2. Flight Control System (internal)                           | 7.51 E-02                     |
| 3. Landing Gear   | 1.89 E-01                     |
| 4. Fuselage Forward   | 9.60 E-03                     |
| 5. Fuselage Center  | 1.97 E-02                     |
| 6. Fuselage Aft   | 2.05 E-03                     |
| 7. Nacelle/Pylons   | 2.63 E-02                     |
| 8. Fuel Systems   | 1.94 E-02                     |
| 9. Engine   | 2.15 E-01                     |
| 10. Electrical Wiring   | 8,80 E-02                     |
| Total   | 7.01 E-01                     |
| Skin-Related Only (1,4,5,6,7)                                 | 1.23 E-01                     |

These probabilities of occurrence then need to be translated into numbers of accidents. Since the probabilities are rates per one million operations, estimates of future operations were needed. GRA computed the total take-offs and landings at US airports from the May 1996 Official Airline Guide (OAG). This estimate is conservative as it excludes U.S. aircraft performing foreign operations. The initial estimate of affected operations was 23,231,976 for 1996.

GRA then excluded aircraft already subject to existing ADs and discounted the number of operations for other aircraft subject to other overlapping directives and rules. After scaling down the total number of operations, the adjusted estimate was 7,150,932 US operations that would be affected by the proposed rule. To this adjusted OAG base, GRA applied the growth rate in FAA airport operations for air carriers and air taxi/commuters through the year

2008. By 2008, the number of affected operations rises to 9,133,300. Based upon the GRA databases and methodology, in the absence of this rule or other preventative action, it is estimated that over the period of 1999 through 2008 ten accidents due to corrosion are likely to occur in the part 121, 129 and 135 fleets.

More than 27 percent of the airplanes subject to this proposal are already 20 years old or older; 7 percent are over 30 years old; and 1 percent of the airplanes are over 40 years old. The number of airplanes in air carrier service operating beyond their expected life is growing larger. As airplanes age, the likelihood of corrosion increases. Corrosion causes the formation of cracks and accelerates the growth of existing cracks. Thus corrosion is an identified problem presenting a growing threat to aviation safety. Experience has demonstrated that, under existing maintenance and inspection procedures, the FAA cannot assure the continuing airworthiness of these airplanes. This constitutes an unacceptable risk to air transportation.

The FAA has extensively deliberated on how to mitigate this risk. Technical experts and academic leaders were consulted. Based upon these considerations and deliberations, the FAA believes that the corrosion prevention and control procedures proposed in this rule are the best approach to assure the continued protection of the subject fleet from corrosion damage that could impact safety.

The primary benefit of this rule is increased aviation safety through assurance that the affected airplanes are free from dangerous corrosion. As has been shown, service difficulty reports of corrosion are increasing, and without this, or a similar rule, the FAA is convinced that unchecked corrosion will cause increasing numbers of future accidents. A secondary benefit from minimizing corrosion is to extend aircraft service life. In response to a corrosion-related accident, the FAA is likely to ground similar aircraft until it can be assured of their airworthiness. As more accidents occur to different aircraft types, or if the inspections show corrective measures can not restore airworthiness, the FAA may determine that aircraft of a certain age need to be retired from the air carrier fleet. Consequently, in addition to expected safety benefits, society would benefit by a longer utilization of the affected aircraft,

thereby reducing the cost of air transportation. The FAA has attempted to quantify the safety benefits and discusses the extended life benefits in qualitative terms.

#### Safety Benefits

Based on GRA's risk assessment analysis, ten accidents due to corrosion could occur within the affected fleet during the ten year period 1999 through 2008. Since the period of analysis for this rule is 20 years, GRA's estimate has been extended by an additional ten years. A straight-line extrapolation based on the additional ten years of operations growth results in an estimate of about 25 accidents over a 20-year period. In this analysis such a straight-line forecast is viewed as a lower-bound estimate, because the GRA analysis did not factor in the joint problem an aging fleet coupled with unchecked metal corrosion increases the rate-of-risk over time. In order to provide an upper bound estimate, a simple, conservative methodology can be used. The actual probability distribution for corrosion-related accidents in the affected fleet is not known. A normal distribution, however, provides a close approximation of a number of other distributions. To be very conservative in this analysis, the FAA assumes that all affected aircraft remain in operation until a corrosion-related accident terminates their service. Under the assumption that the ten accidents from 1999 to 2008 belong to the left tail of a normal distribution of future corrosion-related accidents for the entire 2,900 affected aircraft, then it can be shown that these 10 accidents are more than 2.45 standard deviations from the mean. Assuming that these observations are 2.45 standard deviations from the mean, then 99.3 percent of the fleet would not have a corrosion-caused accident by 2008. This distribution has approximately a twenty-five year standard deviation. Such a distribution would have more than half of these aircraft still without a corrosion-caused accident fifty years from now. If this methodology can be accepted as providing a reasonable estimate of the upper bound of accidents, then in the absence of this rule, slightly more than 50 corrosion-related accidents are estimated to occur in the study period. This, in turn, provides a range of between 25 to 50 corrosion-caused accidents that may occur in 20 years.

As previously discussed, this proposed rule is directed toward the smaller air carrier aircraft. From NTSB data, GRA estimated that the average casualty counts per accident were 1.100 minor injuries, 0.474 serious injuries, and 1.605 fatalities. As a baseline estimate to compare safety benefits with costs, the FAA estimates that the value of: \$38,500 to represent avoiding a minor injury, \$51,800 to represent avoiding serious injury, and \$2.7 million to represent avoiding a statistical fatality. Based on these values the expected benefit of avoiding one such accident today is \$4.6 million, excluding the loss of the airframe, investigation, and ground damage. The FAA believes a conservative benefit estimate of avoiding such an accident is at least \$5 million with a reasonable upper bound value of \$6 million. Using the lower \$5 million estimate and assuming that accidents for the are uniformly distributed over time, then in the thirteenth year the present value benefits of the accidents prevented roughly equals the cost of the proposed rule (at that time the number of accidents equals 34). Thirty-four accidents falls between the upper and lower bound estimates, and is considered a reasonable number that could occur.

This breakeven calculation assumes the proposed rule to be 100 percent effective in preventing these accidents. The FAA can not determine a priori the effectiveness of the proposed rule, but can provide a reasonable effectiveness range and the associated range of benefits. Assuming that the rule would prevent 40 to 80 percent of the expected 25 to 50 accidents, then the rule could be expected to prevent between 9 accidents (40 percent x 25 accidents) to 40 accidents (80 percent x 50 accidents). In the case of the lower bound estimate of 9 accidents, for the present value safety benefits to equal the cost of the rule, the value of an avoided accident would need to increase approximately fourfold. Such an increase is entirely feasible since the assumed 1.6 averted fatalities per accident is conservative. Included in the potentially affected fleet are 178 Beech 1900 airplanes each with 19 passenger seats. If just 2.4 of the prevented accidents are Beech 1900 airplanes with a 75 percent load factor, then the present value benefits exceed the present value of costs.

Exactly how many corrosion-related accidents will occur, which airplanes would suffer such an accident, and how effective

the proposed rule would be can not be determined a priori. The FAA risk assessment estimated that this proposed rule would help to avert 25 to 50 accidents. The rule needs only to be effective enough to prevent 2.4 Beech 1900 accidents with 75 percent of the available seats occupied. It is known with certainty that corrosion currently exists in the fleet and if left unchecked will lead to accidents. Based upon this knowledge, and the estimates contained in this analysis, the FAA concludes that the benefits justify the costs of this proposed rule.

#### Unquantified Benefits

The FAA proposed rule would require scheduled corrosion inspections sooner than the much more costly emergency inspections that would follow a corrosion-caused accident. It is more economical and efficient to correct an unsafe condition proactively, than after an accident makes it clear that corrective action is past due and immediate measures must be taken. Performing the proposed procedures by this rule would allow air carriers to schedule inspections and repairs in a planned, orderly, least cost manner without disrupting aircraft service time. In cases where corrosion is occurring, this proposal would make it known sooner and allow more economical corrective action. On the other hand, without a corrosion inspection plan, metal corrosion will continue, accidents are expected, and once an accident occurs it is highly likely that the FAA will mandate inspections. In that case, there usually is not sufficient time to thoroughly evaluate alternative solutions; instead, immediate corrective action must be selected. Such urgent action is rarely the most economical choice. Compliance with emergency inspections will result in these inspections being unscheduled, airline operators will incur aircraft out-of-service-time costs, airline flight schedules can be disrupted, and flights can be canceled. All of these factors result in reduced airline profits and lower benefits to the traveling public.

As discussed above, it is expected that this proposal would result in corrosion damage observed sooner than it would otherwise, and therefore, the corrections would be less costly. In the absence of the rule, however, it is very possible for some aircraft that corrosion could continue to breakdown the metal undetected

until it becomes uneconomic to repair the damage. In that event, earlier inspection could have extended the service life of such aircraft. It is expected that the proposed rule inspections would result in corrosion damage to be repaired before this damage would cause the aircraft to not be airworthy, or to be retired. Thus the proposed rule can extend the service life of the affected aircraft. Without knowing the condition the affected fleet, it is not possible to accurately quantify the dollar value of this benefit. However, it is possible to provide some idea of the value of longer service life by noting the value of extending the service life by one year of a hypothetical aircraft. In such a case, the annual capital loss equals the value of the aircraft multiplied by airline's rate-of-return on capital. For an aircraft whose resale value is a million dollars and when the rate-of-return on capital equals 10 percent, the annual capital loss is \$100,000. In addition, the travelling public suffers when airline service is unexpectedly reduced by the corrosion-caused premature retirement of this aircraft.

The FAA believes that the unquantified benefits discussed above further support and justify this proposal. Addressing corrosion damage in an orderly fashion, rather than waiting for an emergency action to be required, provides for less interrupted commercial service and extends airplane service life. These outcomes are clearly benefits of this proposal, even though there is insufficient data to quantify these benefits at this time.

#### Comparison of Costs and Benefits

Corrosion is a natural process and occurs because of the tendency over time of metals to return to their original state. Maintenance and inspection records reveal that the presence of corrosion is more prevalent and pervasive in older aircraft. Based upon an independent risk analysis of over 1,500 National Transportation Safety Board accidents and conservative risk assessment results in a forecast of a range between 25 to 50 corrosion-induced accidents over a twenty-year period, with a present value benefit between \$72.5 million and \$145 million. The safety benefits of averting these accidents justify the costs of the proposed rule.

The FAA does not intend to wait for a series of accidents to

provide justification for this proposed rule. The FAA needs the assurance of the corrosion prevention and control program to assure the continued airworthiness of the affected fleet. With this program in place the industry avoids unplanned inspections and maintenance resulting from corrosion-related accidents and benefits by an extended aircraft service life.

This proposed rule would extend to a significant number of airplanes the corrosion prevention and control program found to be necessary for in-service commercial jet airplanes based on studies following the Aloha Boeing 737 accident. Based on the analysis contained herein, the FAA concludes that the benefits of this proposed rule justify the costs.

#### IV. Initial Regulatory Flexibility Analysis

The Regulatory Flexibility Act of 1980 establishes "as a principle of regulatory issuance that agencies shall endeavor, consistent with the objective of the rule and of applicable statutes, to fit regulatory and informational requirements to the scale of the business, organizations, and governmental jurisdictions subject to regulation." To achieve that principle, the Act requires agencies to solicit and consider flexible regulatory proposals and to explain the rationale for their actions. The Act covers a wide range of small entities, including small businesses, not-for-profit organizations, and small governmental jurisdictions.

Agencies must perform a review to determine whether a proposed or final rule will have a significant economic impact on a substantial number of small entities. If the determination finds that it will, the agency must prepare a regulatory flexibility analysis (RFA) as described in the Act.

However, if an agency determines that a proposed or final rule is not expected to have a significant economic impact on a substantial number of small entities, section 605(b) of the 1980 act provides that the head of the agency may so certify, and an RFA is not required. The certification must include a statement providing the factual basis for this determination, and the reasoning should be clear.

Recently, the Office of Advocacy of the Small Business Administration (SBA) published new guidance for Federal agencies in responding to the requirements of the Regulatory Flexibility Act, as amended. Application of that guidance to this proposed rule indicates that it would have a significant impact on a substantial number of small entities. Accordingly, a full regulatory flexibility analysis was conducted and is summarized as follows.

1. A description of the reasons why action by the agency is being considered.

This action is being considered in order to control airplane structural material loss and the detrimental effects of corrosion because existing maintenance or inspection programs may not provide comprehensive, systematic corrosion prevention and control.

2. A succinct statement of the objectives of, and legal basis for, the proposed rule.

The objective of the proposed rule is to ensure the continuing airworthiness of aging airplanes operating in air transportation by requiring all airplanes operated under part 121, all U.S. registered airplanes used in scheduled passenger carrying operations under part 129, and all multiengine airplanes used in scheduled passenger carrying operations conducted under part 135, to include a Federal Aviation Administration (FAA) approved corrosion prevention and control program (CPCP) in the airplane's maintenance or inspection program.

This proposal represents a critical step toward compliance with the Aging Aircraft Safety Act of 1991. In October of 1991, Congress enacted Title IV of Public Law 102 143, the "Aging Aircraft Safety Act of 1991," to address aging aircraft concerns. The act was subsequently recodified as 49 U.S.C. 44717. Section 44717 of Title 49 instructs the Administrator to "prescribe regulations that ensure the continuing airworthiness of aging aircraft."

3. A description of the projected reporting, recordkeeping and other compliance requirements of the proposed rule, including an estimate of the classes or types of small entities that will be subject to the requirement and the type of professional skills necessary for preparation of the report or record.

The proposed rule would not impose any incremental record keeping authority. Existing 14 CFR 43, in part, already prescribes the content, form, and disposition of maintenance, preventive maintenance, rebuilding, and alteration records for any aircraft having a U.S. airworthiness certificate or any foreign registered aircraft used in common carriage under parts 121 or 135. The FAA recognizes, however, that the proposed rule would necessitate additional maintenance work, and consequently, would also require that the additional recordkeeping associated with that work also be performed.

The FAA estimates that each hour of actual inspection and maintenance conducted under the proposal would require an additional 20 percent of an hour (12 minutes) for reporting and record keeping. This record keeping would be performed by the holder of an FAA approved repairman or maintenance certificate. The projected record keeping and reporting costs of the proposal are included as part of the overall costs computed in the evaluation and included below in the Regulatory Flexibility Cost Analysis.

4. An identification, to the extent practicable, of all relevant federal rules that may duplicate, overlap, or conflict with the proposed rule.

The FAA is unaware of any federal rules that would duplicate, overlap, or conflict with the proposed rule.

5. A description and an estimate of the number of small entities to which the proposed rule would apply.

The proposed rule would apply to the operators of all airplanes operated under 14 CFR part 121, all U.S. registered

multiengine airplanes operated under 14 CFR part 129, and all multiengine airplanes used in scheduled operations under 14 CFR part 135. Standard industrial classification coding does not exactly coincide with the subsets of operators who could be affected by the proposed rule. Nevertheless, the following distributions of employment size and estimated receipts per employee for all scheduled air transportation firms (SIC Code 4512) are representative of the operators who would be affected by the proposed rule.

| <u>EMPLOYMENT</u><br><u>CATEGORY</u> | <u>NUMBER</u><br><u>OF FIRMS</u> | <u>ESTIMATED</u><br><u>RECEIPTS PER</u><br><u>EMPLOYEE</u> |
|--------------------------------------|----------------------------------|--|
| 0 - 4                                | 137                              | \$611,695  |
| 5 - 9                                | 45                               | \$510,555  |
| 10 - 19                              | 52                               | \$299,123  |
| 20 - 99                              | 112                              | \$264,065  |
| 100 - 499                            | 78                               | \$232,666  |
| <u>500+</u>                          | <u>70</u>                        | <u>\$252,334</u>   |
| TOTALS                               | 494                              | \$252,214  |

Based on existing operator/airplane distributions, the FAA estimates that 210 operators would be subject to the rule and approximately 132 would actually incur costs.<sup>4</sup> The agency has also estimated the numbers of subject and affected airplanes that each operator uses and has categorized the operators by fleet size in the following table.

| OPERATOR<br>CATEGORY | <u>COUNT OF OPERATORS</u>        |                                   |
|----------------------|----------------------------------|-----------------------------------|
|                      | <u>SUBJECT</u><br><u>TO RULE</u> | <u>AFFECTED</u><br><u>BY RULE</u> |
| <u>(AIRPLANES)</u>   |                                  |                                   |
| 1 - 10               | 119                              | 84                                |
| 11 - 20              | 37                               | 16                                |
| 21 - 30              | 12                               | 4                                 |
| 31 - 40              | 8                                | 6                                 |
| 41 - 50              | 4                                | 4                                 |
| 51 AND UP            | <u>30</u>                        | <u>18</u>                         |
|                      | 210                              | 132                               |

#### 6. Regulatory Flexibility Cost Analysis

The proposed rule would affect certain existing and future production aircraft, and it would also apply to new model airplanes intended for use in scheduled service. This Regulatory Flexibility

---

<sup>4</sup> The remaining operators use airplane models that would be subject to the proposed rule but are already in full compliance.

Cost Analysis focuses on the first of these two categories because: (1) that impact represents almost 99 percent of the evaluated costs of the proposed rule, and (2) it is possible to make some estimate of the distributional impact of these costs based on the existing operator fleet composition.

Table 3 in the Appendix details the computations used to estimate the annualized costs of the proposal per airplane, by model. Column A in Table 3 lists each airplane model and Column B details the estimated counts of the airplanes in each model that would be subject to the proposed rule. As noted in the evaluation, an estimated 7,108 airplanes would be subject to this major provision. These airplanes are included within the regulatory scope of the proposal but the vast majority would be unaffected because they already comply with the proposal. Column C, by comparison, shows the projected counts of those airplanes that would actually be affected; where incremental work would be accomplished and incremental expenses incurred. This column sums to a projected 2,901 airplanes. Column D contains the present value of the projected cost of the major proposal to industry, by airplane model, as computed in the regulatory evaluation and shown previously as Column AG of Table 1 in the Appendix. The present value estimated cost of this provision totals \$80.0 million.

Column E of Table 3 divides the cost-per-model data in Column D by the numbers of affected airplanes per model in Column C to produce the expected present value cost of the proposal per affected airplane. It is useful to consider the annualized equivalent of these costs; that is to say, the annual future payments that would be necessary to equal the present value costs for each model. Such payments are a function of: (1) the assumed interest rate, and (2) the time period over which the future payments would be borne. Consistent with the discount factor, this evaluation applies a 7 percent interest rate. As for the time period, the evaluation assesses costs over a 20-year time period, and this analysis assumes that, on average, the CPCP development and implementation costs would be borne over that period. Based on these two assumptions, the annualized cost of the CPCP would range between \$484 and \$30,170 per airplane (for those airplanes that

would actually be affected.)

Next, the annualized cost estimates, by model, *per affected airplane*, from Table 3 were collated into the original evaluation data set of operators and airplanes. Crosstabulations were performed and aggregated (see Table 4 in the Appendix) to project the expected annualized cost *per operator*. Table 4 includes all 210 of the estimated operators of airplanes that would be subject to the proposed rule, and projects that 132 would actually incur costs. The table includes counts, by operator, the number of airplanes that would be subject to (within the scope of) the proposed rule, and the numbers of airplanes that would actually be affected by the proposal. The data in these calculations are summarized in the table below which shows the average annualized impact per operator; where the operator classifications are grouped both by: (1) the number of all airplanes that the operator uses, and (2) the number of each operator's airplanes that would actually be affected by the proposal.

AVERAGE ANNUALIZED IMPACT PER OPERATOR

| COUNT OF<br>AIRPLANES<br><u>OPERATED</u> | AVERAGE<br>ANNUALIZED<br><u>IMPACT</u> | COUNT OF<br>AIRPLANES<br><u>AFFECTED</u> | AVERAGE<br>ANNUALIZED<br><u>IMPACT</u> |
|--|--|--|--|
| 1-10                                     | \$7,318                                | 1-10                                     | \$14,057                               |
| 11-20                                    | \$17,551                               | 11-20                                    | \$46,479                               |
| 21-30                                    | \$30,711                               | 21-30                                    | \$72,326                               |
| 31-40                                    | \$53,838                               | 31-40                                    | \$104,708                              |
| 41-50                                    | \$64,359                               | 41-50                                    | \$55,789                               |
| 51-60                                    | \$90,769                               | 51-60                                    | \$196,433                              |
| 61-70                                    | \$191,587                              | 61-70                                    | \$195,857                              |
| 71-80                                    | \$144,698                              | 71-80                                    | \$185,253                              |
| 81-90                                    | \$111,116                              | 81-90                                    | \$111,116                              |
| 91-100                                   | \$92,093                               | 91-100                                   | \$112,023                              |
| 100 Plus                                 | \$217,054                              | 100 Plus                                 | \$460,822                              |

7. Affordability Analysis and Disproportionality Analysis

As a measure of the affordability of the proposal, the table

below shows a distribution of the projected annualized impacts of the proposed rule as a percentage of operator annual receipts. Operator receipt levels were estimated assuming: (1) the average of \$252,214 annual receipts *per employee* for SIC Code 4512 operators, described above in Paragraph 5, and (2) an example factor of 5 employees per airplane operated. (This factor varies widely across operators.) The affordability statistic was then calculated for each of the 210 subject operators as the projected annualized cost of the rule for that operator divided by the product of \$252,214 times 5 employees per airplane times the number of airplanes operated. Under these assumptions, the expected annualized cost of the proposal for 209 of the 210 operators falls below 0.6 percent of their respective estimated annualized receipts. For one operator, costs would total 1.38 percent of estimated receipts.

The table can also be used to gauge the disproportionality of the proposed rule's relative burden. The percentage impact calculations are shown for three sizes of operators, depending on the numbers of airplanes that they operate. The calculations show a minor disproportionate impact on smaller operators who are slightly under-represented in the lowest "percentage impact" categories, and correspondingly, slightly over-represented in the higher impact categories.

COUNT OF OPERATORS BY  
PERCENTAGE IMPACT AND BY OPERATOR SIZE

| PERCENTAGE<br>IMPACT | <u>AIRPLANES OPERATED</u> |              |             | <u>Total</u> |
|----------------------|---------------------------|--------------|-------------|--------------|
|                      | <u>1-10</u>               | <u>11-50</u> | <u>51 +</u> |              |
| 0% - .1%             | 68                        | 38           | 19          | 125          |
| .1% - .2%            | 10                        | 10           | 6           | 26           |
| .2% - .3%            | 15                        | 4            | 2           | 21           |
| .3% - .4%            | 16                        | 7            | 3           | 26           |
| .4% - .5%            | 8                         | 2            | 0           | 10           |
| .5% - .6%            | 1                         | 0            | 0           | 1            |
| -----                | --0--                     | --0--        | --0--       | --0--        |
| 1.3% - 1.4%          | 1                         | 0            | 0           | 1            |
| Total                | 119                       | 61           | 30          | 210          |

## 8. Business Closure Analysis

The FAA feels that the annualized average impact of the rule as a function of an affected firm's average annual receipts is low. The agency recognizes, and this evaluation has described, that the potential impact for some operators may be above average and may not be distributed evenly over time. The cost methodology for this evaluation further addresses the fact that it may not be economical to develop and implement a corrosion prevention and control program for some older airplane models with few subject airplanes. The evaluation estimated that program costs would be prohibitive for 11 airplane models, and included a 50 percent reduction of fleet resale value as an estimated cost attributable to the rule.

## 9. Competitiveness Analysis

No quantitative estimate of the proposed rule's potential impact on small business competitiveness has been made. However, the FAA feels that the findings from the Affordability Analysis and the Disproportionality Analysis above support the argument that the proposed rule will not seriously impede small entity competitiveness.

## 10. Description of Alternatives

The FAA has considered several approaches to this proposed rulemaking and has attempted to minimize the potential economic impact of the proposal, especially the impact on the operation of aircraft most likely to be used by small entities. The principal alternative would be to take no new rulemaking action and to rely on the existing corrosion related requirements in parts 23 and 25. The FAA has determined that these existing requirements have not always resulted in a comprehensive and systematic corrosion prevention and control program for either transport, commuter, or small category airplanes. In addition, the FAA has determined that such inaction would not respond to the provisions of 49 U.S.C. 44717, which requires the Administrator to prescribe regulations that ensure the continuing airworthiness of aging aircraft.

A second alternative would be to omit all small aircraft from the proposal since there is an identifiable correlation between smaller firms and smaller aircraft. Again, the FAA opposes this alternative since it would leave the existing problem for a significant segment of the scheduled passenger industry and would create an unacceptable safety inequity.

As proposed, this rulemaking would apply to all airplanes operated under part 121, all U.S. registered multiengine airplanes operated under part 129, and all multiengine airplanes used in scheduled operations under part 135. The proposed rule would not include helicopters, single-engine airplanes operated under part 135 or part 129, airplanes used in cargo operations under part 135, or airplanes used in unscheduled (on-demand) operations under part 135.

The aircraft and operations omitted from this proposal are not exclusively operated by small entities, but the FAA holds that the excluded airplane categories are more likely to be operated by small entities than, for example, large transport category airplanes would be. As noted above, the proposed rule would actually affect some 2,900 airplanes. By comparison, the exclusions described here, taken together, remove an estimated 5,023 additional aircraft from the proposal. This includes, with overlap, 1,441 helicopters; 4,663 aircraft used in on-demand operations; and 1,812 single-engine aircraft.

The FAA specifically requests comments regarding the exclusion of such aircraft operations from this proposed rule.

#### 11. Compliance Assistance

In its efforts to assist small entities and other affected parties in complying with the proposed rule, the FAA is publishing an advisory circular, "Development of Corrosion Prevention and Control Programs." A notice of availability for this circular will be published concurrently with the proposed rule. This circular details acceptable means of compliance with the proposed rule.

Additionally, the FAA has developed a CPCP for a generic,

civil, twin-engine aircraft and will make this document available as part of the appendix to the advisory circular accompanying the proposed rule. This document can serve as a core framework for the baseline program for defining the corrosion prevention and control requirements for a subject airplane model based on the average operating profile and operating environment. This generic CPCP model would be particularly useful to small operators in the event that the type certificate holder for a given model is not available to develop the CPCP for that model.

V. Trade Impact Assessment

The Trade Agreement Act of 1979 prohibits Federal agencies from engaging in any standards or related activities that create unnecessary obstacles to the foreign commerce of the United States. Legitimate domestic objectives, such as safety, are not considered unnecessary obstacles. The statute also requires consideration of international standards and where appropriate, that they be the basis for U.S. standards.

In accordance with the above statute, the FAA has assessed the potential effect of this proposed rule and has determined that the objective of the rule is to maintain the current level of safety. In addition, the rule would have only a domestic impact and therefore create no obstacles to the foreign commerce of the United States.

VI. Unfunded Mandates Assessment

Title II of the Unfunded Mandates Reform Act of 1995 (the Act), enacted as Pub. L. 104-4 on March 22, 1995, requires each Federal agency, to the extent permitted by law, to prepare a written assessment of the effects of any Federal mandate in a proposed or final agency rule that may result in the expenditure by State, local, and tribal governments, in the aggregate, or by the private sector, of \$100 million or more (adjusted annually for inflation) in any one year. Section 204(a) of the Act, 2 U.S.C. 1534(a), requires the Federal agency to develop an effective process to permit timely input by elected officers (or their designees) of State, local, and tribal governments on a proposed

"significant intergovernmental mandate." A "significant intergovernmental mandate" under the Act is any provision in a Federal agency regulation that will impose an enforceable duty upon State, local, and tribal governments, in the aggregate, of \$100 million (adjusted annually for inflation) in any one year. Section 203 of the Act, 2 U.S.C. 1533, which supplements section 204(a), provides that before establishing any regulatory requirements that might significantly or uniquely affect small governments, the agency shall have developed a plan that, among other things, provides for notice to potentially affected small governments, if any, and for a meaningful and timely opportunity to provide input in the development of regulatory proposals.

The FAA determines that this proposed rule would not contain a significant intergovernmental or private sector mandate as defined by the Act.

APPENDIX

TABLE 1 - PROGRAM COST CALCULATIONS

| MODELGROUP<br>(A)               | AVG-MTOW<br>(B) | AVG-YR-MAN<br>(C) | COUNT<br>(D) |
|---------------------------------|-----------------|-------------------|--------------|
| A300                            | 372,657         | 1989.4            | 76           |

REGULATORY IMPACT  
Executive Order 12866 and DOT Regulatory Policies and  
Procedures  
Economic Evaluation Summary

Proposed changes to Federal regulations must undergo several economic analyses. First, Executive Order 12866 directs that each Federal agency shall propose or adopt a regulation only upon a reasoned determination that the benefits of the intended regulation justify its costs. Second, the Regulatory Flexibility Act of 1980 requires agencies to analyze the economic impact of regulatory changes on small entities. Third, the Trade Agreements Act (19 U.S.C. section 2531-2533) prohibits agencies from setting standards that create unnecessary obstacles to the foreign commerce of the United States. In developing U.S. standards, this Trade Act also requires the consideration of international standards and, where appropriate, that they be the basis of U.S. standards. And fourth, the Unfunded Mandates Reform Act of 1995 requires agencies to prepare a written assessment of the costs, benefits and other effects of proposed or final rules that include a Federal mandate likely to result in the expenditure by State, local or tribal governments, in the aggregate, or by the private sector, of \$100 million or more annually (adjusted for inflation).

In conducting these analyses, the FAA has determined this rule:

- 1) has benefits which do justify its costs, is a "significant regulatory action" as defined in the Executive Order and is "significant" as defined in DOT's Regulatory Policies and Procedures;
- 2) would have a significant impact on a substantial number of small entities;
- 3) would not constitute barriers to international trade; and
- 4) does not impose an unfunded mandate on state, local, or tribal governments, or on the private sector. These analyses, available in the docket, are summarized below.

Description of Costs

The primary costs of the proposed rule would be borne by those scheduled operators of multiengine airplanes not currently subject to a mandatory corrosion prevention and control program. Additional costs would also be incurred by manufacturers who

participate in the assessment and development of the corrosion programs for the affected airplane models, but this evaluation assumes that all such costs would eventually be passed through to the operators. The FAA itself would incur relatively minor costs for reviewing and approving (1) the corrosion prevention and control programs, and (2) the incorporation of these new procedures into the existing maintenance and inspection programs.

Note that the attributed costs of this proposal do not include the expense of making major repairs or modifications that may be found necessary during the inspections mandated by this proposal. While the agency recognizes that such repairs may constitute a significant expense, their costs are not attributed to this proposed rule because existing FAA regulations require that repairs be made as found to be necessary to assure the continued airworthiness of the airplane.

The methodology used in the evaluation first computes the costs that would be incurred if it were economically viable for all of the airplanes in the affected fleet to meet the requirements of the proposed rule. Based on these costs, and their comparison to the approximate fleet value, the methodology later estimates the numbers of airplanes and models where compliance would not actually be economically viable, and where instead, the airplanes would likely be retired from scheduled service.

Approximately 7,100 airplanes were identified as being subject to the proposed rule. For the majority of these airplanes, the proposal would not generate any additional costs, since the subject airplanes already comply with airworthiness directives that parallel the proposal. Some 2,900 airplanes would be *affected* by the proposal in one manner or another, and as such would incur costs.

In projecting the cost of the proposed rule, development cost factors were estimated for each airplane model. These factors, ranging from zero to one, represent the proportion of full CPCP development costs that would be incurred for each airplane model group. The factors account for the fact that full compliance programs are in place for some models (factor = 0) and that the development costs for some other models would be reduced to less than 1 either due to their similarities to other models or because some models have partially compliant programs. The factors also account for the fact that airplanes certificated under existing § 25.571, amendment 45 or later, are already required to undergo an

evaluation of their strength, detail design, and fabrication to show that failure due to corrosion will be avoided throughout the operational life of the airplane.<sup>1</sup> For these newer models, development factors of .1 were assigned to represent the estimated additional effort (equal to one-tenth of a completely incremental CPCP evaluation and development) that would be necessary to comply with the proposed rule. Taken together, the various cost factors produce an estimated cost equivalence of approximately 47 full CPCP development efforts among the 88 model groups that were identified.

The cost methodology employs a three step functional estimate of the time needed to develop each CPCP. First, the nominal number of development hours is estimated as a function of the average maximum takeoff weight (MTOW) for each model.

$$\text{Eq. 1.} \quad \text{Hours} = 2,296 + (.04 \times \text{MTOW})$$

This equation was derived from a two-point linear plot of the estimated costs expended to develop the CPCP for two existing airplane models (the DC-9 and the Piper Navajo). The results of the Eq. 1 estimates were then multiplied by the development factors to account for the reduced development efforts for similar or partially compliant models described above. Finally, a third factor (described below) was applied to account for the possibility that a CPCP would not be developed for an airplane model where it was reasonably expected that the airplanes of that model would have been retired before the effective period of the proposed rule.

The hours for development were converted into cost estimates for each model by applying a fully burdened engineering cost rate of \$95 per hour for CPCP development. This produced a cost per model ranging between \$32,000 and \$427,000. The estimated development cost for all models totals to \$10.4 million, or \$7.9 million expressed in present value terms.

It was also necessary to estimate the FAA's costs to review and approve the CPCP's described above. The evaluation employs a simple factor of 80 hours of review per newly developed CPCP, at a burdened cost rate of \$55 per hour. This produces estimated costs of \$4,400 per model and for the affected fleet the total cost is \$246,400, or in present value terms \$141,171.

---

<sup>1</sup> Similar requirements exist under §23.574 for commuter category airplanes, and damage tolerance requirements related to the effects of corrosion for both composite and metallic airframe structure are

Similar to the "development" cost factors described above, the evaluation also employed "implementation" cost factors for each model. The implementation factors also range between zero and one, and constitute the expected proportions of full incremental implementation effort that would be caused by the proposal for each model. In addition to accounting for the existence of fully or partially compliant CPCP's themselves, the implementation factors also account for those cases whereby an industry developed CPCP may exist for a given airplane model, but either its implementation is not currently mandated by FAA direction, or the associated work level would be increased by this proposal. The evaluation projects the work load equivalence of full incremental implementation in 60 of the 88 affected model groups.

The first stage of implementation for the proposed rule would be incorporating the model-specific CPCP into an operator's maintenance or inspection program. Data were cross-tabulated to determine the distribution and number of unique combinations of operators and subject airplane models to estimate the number of new CPCP's that would need to be incorporated into existing operator programs (487 operator-model combinations.) In turn, the expected cost of these CPCP incorporations for the operators of each model were computed by multiplying the number of operator-model combinations, by an estimated 40 hours incremental work per incorporated program, and by a unit labor rate of \$55 per hour. The total expected cost of this work, across all operator-model combinations, sums to \$609,400, or \$434,494 in present value.

Similar to their review of the actual CPCP's, FAA personnel would also need to review and approve the incorporation of the CPCP's into the existing maintenance and inspection programs of the operators. The calculation of these costs parallels the operator cost calculation from above with the exception that only 8 hours of review work would be necessary per incorporation. These "second" FAA review costs sum to \$121,880, or \$79,683 in present value. FAA review costs are expected to be incurred in 2003.

Next, the calculation of the actual operator inspection activities that would result from the CPCP's are computed. The evaluation assumes that the proposed rule would become final at the end of the year 2000, that the required new CPCP's would be developed by the end of the year 2002, and that inspections and

---

found in §§23.573(a) and (b), respectively.

maintenance, where scheduled, would start in the year 2003. The evaluation uses a 20-year study period (from the effective date of the rule) and, therefore, assesses expected costs through the year 2020. The inspections for any particular airplane would not begin before the time specified in the CPCP for that model, and the initiation of work under the CPCP's would vary by airplane model and by individual airplane structure. This evaluation assumes that the preponderance of corrosion related inspection and maintenance work under the proposed rule would begin in the tenth year of an airplane's operation. The evaluation further assumes that the airplanes under this proposal would not be retired from service until age 35.

The four parameters described above are used to estimate the projected number of years that inspections under this proposal would be conducted within the study period. For each airplane model, this period is calculated as the intersection of: (1) the years included within the study period, and (2) the years where the average age of the affected airplanes would be between 10 and 35 years old.

The projected, average number of years that each model would be inspected under the program multiplied by the number of affected airplanes in each model produces the expected airplane-years of program coverage under the proposal, by model. This figure, in turn, is multiplied by the projected number of hours of work per year that the CPCP would require, and by the cost of labor per hour for that work, to produce the estimated cost of implementation. The assumed unit cost rate is \$55 per hour. The projected annual number of work hours for each airplane under the proposal is computed as a function of airplane size (maximum takeoff weight).

$$\text{Eq. 2.} \quad \text{Hours} = 88 + (.0006 \times \text{MTOW})$$

This functional estimate was derived from a linear regression of the airplane weights and the annual work-hour projections included in 13 CPCP airworthiness directives (the original eleven plus two subsequent directives for the Casa C-212 and the Fokker F-27) mandating industry developed corrosion programs. The "hours per airplane per year" results are the product of the functional estimate in Equation 2, above, multiplied by the implementation factors described previously. Finally, the projected inspection costs over the study period are computed as the product of: (1)

the numbers of airplane-years of coverage under the program, (2) the work hours per airplane per year, (3) a unit cost factor of \$55 per hour for the inspection and maintenance work, and (4) a factor of 1.2 to account for the 20 percent overhead of paperwork and record keeping. These computations forecast a total of \$155 million (\$64.5 million in present value) in inspection costs through the year 2020.

In addition to the actual costs of inspecting the airplanes, costs can also be attributed to the incremental downtime that would be necessitated by the work required under the proposal. The evaluation assumes that each 40 hours of work necessitated by the CPCP requirement would require 1 additional day of airplane downtime. The projected additional down-days are computed as the product of: (1) the number of airplane years in the program, (2) the work hours per airplane per year, and (3) the assumed unit factor of 1 down-day per 40 hours of added work. Under these assumptions, the evaluation projects 58,658 days of additional downtime for the affected fleet throughout the twenty-year study period as a result of the work attributed to the proposal.

The economic valuation of this downtime was computed under the assumption that the average productive return on capital is equal to 7 percent of the value of that capital, per year. Accordingly, the downtime costs were calculated as the product of: (1) the number of additional downtime days that would be required, divided by 365 days per year, (2) the estimated economic value of the fleet for each model, calculated at the median program year for that model, and (3) the 7 percent per year assumed rate of return on capital. These costs total \$21.5 million, or in terms of present value \$8.6 million.

Next, the present values (7 percent discount rate) of the four component industry costs were calculated. For computational expediency, the present value calculations assume that all development costs occur in the year 2002, operator incorporation costs occur in the year 2003, and both the inspection and downtime costs occur in the median year of the inspection program for each model. The present value of the total expected cost of the proposed rule to industry is \$81.5 million, not including the FAA review costs described earlier.

PRESENT VALUE COST TO THE INDUSTRY

| Development | Operator    | Inspection   | Downtime    | Total Industry |
|-------------|-------------|--------------|-------------|----------------|
| <u>Cost</u> | <u>Cost</u> | <u>Cost</u>  | <u>Cost</u> | <u>Cost</u>    |
| \$7,913,985 | \$434,494   | \$64,524,942 | \$8,626,515 | \$81,499,936   |

As noted in the introductory remarks of the cost section, the calculations described above assume that all of the subject airplanes would comply with the CPCP requirements of the proposed rule. At this point, however, the evaluation recognizes that it may not, in fact, be economical to develop and implement a CPCP for some older airplane models with very few subject airplanes. In order to account for this possibility, the evaluation compares the expected industry costs of the rule with the estimated fleet values of the affected models. For 11 models, the program costs are projected to be prohibitive and the expected compliance costs for the model are removed from the program implementation costs, and instead, a reduction of 50 percent of the value of the airplanes in that model is assigned as the attributed cost of the proposed rule for that model. Under this scenario, the present value costs to industry of the proposed rule would consist of \$78.7 million in implementation costs and \$1.3 million in costs resulting from reductions in airplane value due to a forecast economic inability to comply with the proposal. The total present-value cost of the proposed requirement to industry is projected at \$80.0 million. The present value of the FAA cost for review is estimated at \$220,885.

In addition to the proposed requirements for existing airplane models, the proposal would also require baseline corrosion prevention and control programs for future, newly certificated airplane models that would likely be marketed for scheduled passenger operations. For the purpose of example, the evaluation assumes one new certification per year between the effective date of the proposed rule and the end of the evaluation study period. In order to represent the likely sizes of the airplanes that might be certificated, the existing airplane models evaluated above were sorted by maximum takeoff weight, and were grouped into 18 classifications. The average weight of the airplanes in each of these 18 classes was then computed to represent the likely size of airplanes that would be certificated in each of the 18 years of the study period. In an effort to remove the bias of the order in which the various size airplanes were presumed to be certificated

over time, the 18 airplane weight classes were assigned randomly across the 18 study years.

As noted above, the existing certification standards for all part 25 models and for certain part 23 models (commuter category and composite materials airplanes) require that future airplane models undergo an evaluation of their strength, detail design, and fabrication to show that failure due to corrosion will be avoided throughout the operational life of the airplane. As previously described, a development factor of .1 was assigned to the existing airplane models that were certificated to these standards, and in a parallel fashion, one-tenth of a full development cost is also assigned to the affected future airplane models. It should be noted that the existing certification procedures that would cause this reduced incremental impact are not required for metallic (non-composite material) airplanes in the normal, utility, or acrobatic categories for part 23. The evaluation assigns to these airplanes (weighing 12,500 pounds or less) a CPCP factor of .5, which recognizes that: (1) in the absence of this rule, these airplanes would not be substantially compliant with a CPCP requirement, but (2) substantial savings (one-half) in CPCP development would be realized as the development of the corrosion program would be included in the development of the airplane itself, rather than retroactively considered for an existing model.

The evaluation also recognizes that not all future airplane models will likely be marketed or used for scheduled passenger operations. In the absence of model-specific information, the evaluation assumes that future models under 6,000 pounds (2 of the 18 models considered here) would not incur additional costs as a result of this rule.

Returning to the computations, the estimated hours necessary to develop a CPCP for each airplane model in the example forecast were computed using the same formula that was used above (Eq 1;  $\text{Hours} = 2,296 + (.04 \times \text{MTOW})$ ) with the result being multiplied by a factor of either .1 or .5 depending, respectively, on whether the airplane model was above or below 12,500 pounds. Again, parallel to the previous computations, the development costs were computed by multiplying the expected development hours by an engineering labor rate of \$95 per hour. Similarly, the expected FAA review costs were computed as 80 hours of review per CPCP, multiplied by a unit labor factor of \$55 per hour. Finally, the industry and FAA costs were combined for a total projected development and review

cost of \$1.3 million. The present values of these costs sum to \$563,835.<sup>2</sup>

In summary, over the twenty-year study period of this analysis, the proposed CPCP operating requirement for existing certification models is projected to cost \$80.0 million to the industry and \$221 thousand to the FAA (all costs in present value.) For newly type certificated models, the proposed rule is projected to cost \$534 thousand to the industry and \$30 thousand to the FAA.

#### Description of Benefits

The purpose of this rulemaking is to assure that corrosion does not degrade the airworthiness of affected air carrier airplanes. The corrosion prevention and control program contained in this proposal originates, in part, from the recommendations following the investigations of the Aloha Boeing 737-200 accident on April 28, 1988 when 18 feet of upper fuselage separated from the airplane in flight. The National Transportation Safety Board determined the probable cause of that accident was that corrosion and metal fatigue led to separation of the airplane's skin and structure.

All metal airframe structures are vulnerable to corrosion and older aircraft are much more likely to experience corrosion than newer airplanes. Corrosion is a natural process and occurs because of the tendency of metals over time to return to their original state. Maintenance and inspection records reveal that the presence of corrosion is more prevalent and pervasive in older aircraft. A review of the annual total of the number of listings in the Service Difficulty Reports involving corrosion over a subset of U.S. commercial airplanes provides a sense of the magnitude of the problem.

---

<sup>2</sup> This evaluation does not address the "inspection" portion of the costs that would result for these future models since, within the study period, very few airplanes would be certificated and produced, and then age to the point where the inspections from a CPCP would be prevalent. Furthermore, the present values of these few, out-year expenses would be negligible relative to the other costs of this proposal.

Number of Service Difficulty Reports Involving "Corrosion"

| <b>Total</b>  | <b>4048</b> | <b>3021</b> | <b>5125</b> | <b>5142</b> | <b>5183</b> | <b>5187</b> | <b>5286</b> | <b>5123</b> |

The problem of corrosion is that it is both prevalent and destructive. Multiple Site Damage (MSD) is an undesirable condition caused by wide spread cracking of an airplane structure. R. Plelloux, et al in "Fractographic Analysis of Initiation and Growth of Fatigue Cracks at Rivet Holes writes "In the case of MSD, fatigue cracks are reported to initiate at rivet holes in the fuselage lap joints after the epoxy bond failed as a result of corrosion in high humidity environments ... the cracks grow to a length of approximately 6 to 8 mm (.25 inches to .30 inches) on each side of the rivet, before fracture by tensile instability. Note that rivets (on the airplane skin) are spaced an inch apart center to center. Crack growth in service has been reported to occur over 20,000 to 40,000 cycles." Thus corrosion can cause multiple cracks around a rivet. When the cracks reach a length of .25 to .3 inches fracture by tensile instability occurs. Cracks have been reported in aircraft with much fewer cycles than those recently upgraded from Stage 2 to Stage 3 standards in the last ten years.

Corrosion's detrimental effects are not limited to rivet holes. Corrosion decreases the size of structural members and can also have bad synergisms with factors leading to early cracking. When a fatigue crack reaches a corroded section the growth rate of the crack increases by a factor of 3 (J.P. Chubb, et al, "The Effect of Exfoliation Corrosion on the Fatigue Behavior of Structural Aluminum Alloys"). The NTSB report to the FAA on the Aloha Boeing 737 accident cited finding corrosion in the throttle cables (in the leading edge). When the appropriate cable sections

were removed from the aircraft and inspected there were indications of corrosion and this corrosion likely weakened the cables so that they separated at lower than design load. Corrosion was present for the entire length of that portion of the cable routed through the leading edge.

Since different sources may use slightly different definitions, for clarity, several important definitions are now identified. The definition of multiple site damage is a source of widespread fatigue damage characterized by the simultaneous presence of fatigue cracks in the same structural element (i.e., fatigue cracks that may coalesce with or without other damage leading to a loss of required residual strength). Widespread fatigue damage (WFD) in a structure is characterized by the simultaneous presence of cracks at multiple structural details that are of sufficient size and density whereby the structure will no longer meet its damage tolerance requirement (i.e., to maintain its required residual strength after partial structural failure). Multiple element damage (MED) is a source of widespread fatigue damage characterized by the simultaneous presence of fatigue cracks in similar adjacent structural elements.

The Boeing 737 lap splice design originally required a good bond for load transfer. Environmental degradation caused the bond to deteriorate to the point where all of the load transfer ended up transferred through the fasteners, which were never designed to take that load. MED can also result from corrosive environments as well.

#### Benefits - A Risk Assessment

The FAA employed GRA<sup>3</sup>, Inc. to provide a risk assessment to help make determinations regarding the likelihood of aviation accidents related to corrosion. Under this contract, GRA qualitatively identified and characterized the types of potential corrosion hazards faced by aircraft and developed a method to assign quantitative risk evaluation.

For their analysis, GRA relied upon the National Transportation Safety Board (NTSB) Aviation/Incident Database. The NTSB database contains detailed information on over 37,000 accidents that have been catalogued since 1985; it includes a

"sequence of events" history for each accident that describes the events leading up to an accident. A broad search of the 37,000 NTSB accidents resulted in a total of 1,551 accidents that were examined in detail.

The FAA Incident Data System (AIDS) was used to help assess the impacts of the Airworthiness Directives issued in the early 1990's. The FAA Service Difficulty Reporting System (SDRS) assisted by providing information assessing the incident and severity of the corrosion problem, as well as information of the effectiveness of current safety programs. GRA found it difficult to link incident and service difficulty reports with observed or anticipated changes in accident or incident rates. As a result, GRA took a conservative approach by not attempting to quantify benefits using either AIDS or SDRS.

The methodology employed by GRA is known as "event tree" analysis. Event tree analysis is used to characterize a chain of events leading to accidents under a variety of circumstances. This methodology has been used successfully in other environments where, as with aircraft, the probabilities of occurrence are very small.

Event trees are defined by:

- An initiating event
- A further chain of events related to "safety functions", which represent aircraft system responses or operator actions when a particular event occurs
- A terminating event
- Estimation of success and failure probabilities at relevant nodes in the event tree

An event tree should define a comprehensive set of accident sequences that encompass the effects of all possible accidents involving the aircraft. These trees begin with the initiating event, or the starting point. Following the initiating event, the set of events related to safety functions, which end with the terminating, event is specified. With the event tree constructed information from the NTSB, 1,551 accidents were used to populate (provide probability estimates) the tree.

Event trees with corrosion-induced initiating events were

---

<sup>1</sup>"CORROSION PREVENTION AND CONTROL RISK ANALYSIS", FAA Contract No. DTFA01-93-C-00066, Work Order 52, Prepared by GRA, Incorporated, May 12, 1999. A copy of this document is filled in the docket.

defined based on these records for the following ten aircraft systems:

- Flight control surfaces/attachments
- Flight control system-internal
- Landing gear
- Fuselage forward
- Fuselage center
- Fuselage aft
- Fuel system
- Nacelle/Pylons
- Engines
- Electrical systems and wiring

The subsequent events, which occur after the initiating event, were defined with the following generic sequence:

- Operator error in addressing/mitigating the initiating event
- Failure of operator to recover after initial failure to address/mitigate
- Failure of flight control function
- Failure of operator to recover flight control function
- Failure of landing gear during take-off or landing
- Failure of operator to recover landing gear function

Beginning with the initiating event probability, each subsequent event probability is multiplied across each branch. The multiplication of events along each branch results in the probability of an outcome (or terminating event). Summing the terminating event probabilities, which end in damage, equals the probability of a corrosion-related accident by aircraft system. GRA's Table 2 with the estimated corrosion-related accident rates by aircraft system is reproduced below.

| Estimated Corrosion-Related Accident Rates by Aircraft System |                               |
|---|-------------------------------|
| Aircraft System   | Rate per 1,000,000 Operations |
| 1. Flight Control Attachments                                 | 6.53 E-02                     |
| 2. Flight Control System (internal)                           | 7.51 E-02                     |
| 3. Landing Gear   | 1.89 E-01                     |
| 4. Fuselage Forward   | 9.60 E-03                     |
| 5. Fuselage Center  | 1.97 E-02                     |
| 6. Fuselage Aft   | 2.05 E-03                     |
| 7. Nacelle/Pylons   | 2.63 E-02                     |
| 8. Fuel Systems   | 2.15 E-01                     |
| 9. Engine   | 8.80 E-02                     |
| 10. Electrical Wiring   |                               |
| Total   | 7.01 E-01                     |
| Skin-Related Only (1, 4, 5, 6, 7)                             | 1.23 E-01                     |

These probabilities of occurrence then need to be translated into numbers of accidents. Since the probabilities are rates per one million operations, estimates of future operations were needed. GRA computed the total take-offs and landings at US airports from the May 1996 Official Airline Guide (OAG). This estimate is conservative as it excludes U.S. aircraft performing foreign operations. The initial estimate of affected operations was 23,231,976 for 1996.

GRA then excluded aircraft already subject to existing ADs and discounted the number of operations for other aircraft subject to other overlapping directives and rules. After scaling down the total number of operations, the adjusted estimate was 7,150,932 US operations that would be affected by the proposed rule. To this adjusted OAG base, GRA applied the growth rate in FAA airport operations for air carriers and air taxi/commuters through the year 2008. By 2008, the number of affected operations rises to 9,133,300. Based upon the GRA databases and methodology, in the absence of this rule or other preventative action, it is estimated that over the period of 1999 through 2008 ten accidents due to

corrosion are likely to occur in the part 121, 129 and 135 fleets.

More than 27 percent of the airplanes subject to this proposal are already 20 years old or older; 7 percent are over 30 years old; and 1 percent of the airplanes are over 40 years old. The number of airplanes in air carrier service operating beyond their expected life is growing larger. As airplanes age, the likelihood of corrosion increases. Corrosion causes the formation of cracks and accelerates the growth of existing cracks. Thus corrosion is an identified problem presenting a growing threat to aviation safety. Experience has demonstrated that, under existing maintenance and inspection procedures, the FAA cannot assure the continuing airworthiness of these airplanes. This constitutes an unacceptable risk to air transportation.

The FAA has extensively deliberated on how to mitigate this risk. Technical experts and academic leaders were consulted. Based upon these considerations and deliberations, the FAA believes that the corrosion prevention and control procedures proposed in this rule are the best approach to assure the continued protection of the subject fleet from corrosion damage that could impact safety.

The primary benefit of this rule is increased aviation safety through assurance that the affected airplanes are free from dangerous corrosion. As has been shown, service difficulty reports of corrosion are increasing, and without this, or a similar rule, the FAA is convinced that unchecked corrosion will cause increasing numbers of future accidents. A secondary benefit from minimizing corrosion is to extend aircraft service life. In response to a corrosion-related accident, the FAA is likely to ground similar aircraft until it can be assured of their airworthiness. As more accidents occur to different aircraft types, or if the inspections show corrective measures can not restore airworthiness, the FAA may determine that aircraft of a certain age need to be retired from the air carrier fleet. Consequently, in addition to expected safety benefits, society would benefit by a longer utilization of the affected aircraft, thereby reducing the cost of air transportation. The FAA has attempted to quantify the safety benefits and discusses the extended life benefits in qualitative terms.

#### Safety Benefits

Based on GRA's risk assessment analysis, ten accidents due to

corrosion could occur within the affected fleet during the ten year period 1999 through 2008. Since the period of analysis for this rule is 20 years, GRA's estimate has been extended by an additional ten years. A straight-line extrapolation based on the additional ten years of operations growth results in an estimate of about 25 accidents over a 20-year period. In this analysis such a straight-line forecast is viewed as a lower-bound estimate, because the GRA analysis did not factor in the joint problem an aging fleet coupled with unchecked metal corrosion increases the rate-of-risk over time. In order to provide an upper bound estimate, a simple, conservative methodology can be used. The actual probability distribution for corrosion-related accidents in the affected fleet is not known. A normal distribution, however, provides a close approximation of a number of other distributions. To be very conservative in this analysis, the FAA assumes that all affected aircraft remain in operation until a corrosion-related accident terminates their service. Under the assumption that the ten accidents from 1999 to 2008 belong to the left tail of a normal distribution of future corrosion-related accidents for the entire 2,900 affected aircraft, then it can be shown that these 10 accidents are more than 2.45 standard deviations from the mean. Assuming that these observations are 2.45 standard deviations from the mean, then 99.3 percent of the fleet would not have a corrosion-caused accident by 2008. This distribution has approximately a twenty-five year standard deviation. Such a distribution would have more than half of these aircraft still without a corrosion-caused accident fifty years from now. If this methodology can be accepted as providing a reasonable estimate of the upper bound of accidents, then in the absence of this rule, slightly more than 50 corrosion-related accidents are estimated to occur in the study period. This, in turn, provides a range of between 25 to 50 corrosion-caused accidents that may occur in 20 years.

As previously discussed, this proposed rule is directed toward the smaller air carrier aircraft. From NTSB data, GRA estimated that the average casualty counts per accident were 1.100 minor injuries, 0.474 serious injuries, and 1.605 fatalities. As a baseline estimate to compare safety benefits with costs, the FAA estimates that the value of: \$38,500 to represent avoiding a minor injury, \$51,800 to represent avoiding serious injury, and \$2.7 million to represent avoiding a statistical fatality. Based on

these values the expected benefit of avoiding one such accident today is \$4.6 million, excluding the loss of the airframe, investigation, and ground damage. The FAA believes a conservative benefit estimate of avoiding such an accident is at least \$5 million with a reasonable upper bound value of \$6 million. Using the lower \$5 million estimate and assuming that accidents for the are uniformly distributed over time, then in the thirteenth year the present value benefits of the accidents prevented roughly equals the cost of the proposed rule (at that time the number of accidents equals 34). Thirty-four accidents falls between the upper and lower bound estimates, and is considered a reasonable number that could occur.

This breakeven calculation assumes the proposed rule to be 100 percent effective in preventing these accidents. The FAA can not determine a priori the effectiveness of the proposed rule, but can provide a reasonable effectiveness range and the associated range of benefits. Assuming that the rule would prevent 40 to 80 percent of the expected 25 to 50 accidents, then the rule could be expected to prevent between 9 accidents (40 percent x 25 accidents) to 40 accidents (80 percent x 50 accidents). In the case of the lower bound estimate of 9 accidents, for the present value safety benefits to equal the cost of the rule, the value of an avoided accident would need to increase approximately fourfold. Such an increase is entirely feasible since the assumed 1.6 averted fatalities per accident is conservative. Included in the potentially affected fleet are 178 Beech 1900 airplanes each with 19 passenger seats. If just 2.4 of the prevented accidents are Beech 1900 airplanes with a 75 percent load factor, then the present value benefits exceed the present value of costs.

Exactly how many corrosion-related accidents will occur, which airplanes would suffer such an accident, and how effective the proposed rule would be can not be determined a priori. The FAA risk assessment estimated that this proposed rule would help to avert 25 to 50 accidents. The rule needs only to be effective enough to prevent 2.4 Beech 1900 accidents with 75 percent of the available seats occupied. It is known with certainty that corrosion currently exists in the fleet and if left unchecked will lead to accidents. Based upon this knowledge, and the estimates contained in this analysis, the FAA concludes that the benefits justify the costs of this proposed rule.

### Unquantified Benefits

The FAA proposed rule would require scheduled corrosion inspections sooner than the much more costly emergency inspections that would follow a corrosion-caused accident. It is more economical and efficient to correct an unsafe condition proactively, than after an accident makes it clear that corrective action is past due and immediate measures must be taken. Performing the proposed procedures by this rule would allow air carriers to schedule inspections and repairs in a planned, orderly, least cost manner without disrupting aircraft service time. In cases where corrosion is occurring, this proposal would make it known sooner and allow more economical corrective action. On the other hand, without a corrosion inspection plan, metal corrosion will continue, accidents are expected, and once an accident occurs it is highly likely that the FAA will mandate inspections. In that case, there usually is not sufficient time to thoroughly evaluate alternative solutions; instead, immediate corrective action must be selected. Such urgent action is rarely the most economical choice. Compliance with emergency inspections will result in these inspections being unscheduled, airline operators will incur aircraft out-of-service-time costs, airline flight schedules can be disrupted, and flights can be canceled. All of these factors result in reduced airline profits and lower benefits to the traveling public.

As discussed above, it is expected that this proposal would result in corrosion damage observed sooner than it would otherwise, and therefore, the corrections would be less costly. In the absence of the rule, however, it is very possible for some aircraft that corrosion could continue to breakdown the metal undetected until it becomes uneconomic to repair the damage. In that event, earlier inspection could have extended the service life of such aircraft. It is expected that the proposed rule inspections would result in corrosion damage to be repaired before this damage would cause the aircraft to not be airworthy, or to be retired. Thus the proposed rule can extend the service life of the affected aircraft. Without knowing the condition the affected fleet, it is not possible to accurately quantify the dollar value of this benefit. However, it is possible to provide some idea of the value of longer service life by noting the value of extending the service life by one year of a hypothetical aircraft. In such a case, the annual

capital loss equals the value of the aircraft multiplied by airline's rate-of-return on capital. For an aircraft whose resale value is a million dollars and when the rate-of-return on capital equals 10 percent, the annual capital loss is \$100,000. In addition, the travelling public suffers when airline service is unexpectedly reduced by the corrosion-caused premature retirement of this aircraft.

The FAA believes that the unquantified benefits discussed above further support and justify this proposal. Addressing corrosion damage in an orderly fashion, rather than waiting for an emergency action to be required, provides for less interrupted commercial service and extends airplane service life. These outcomes are clearly benefits of this proposal, even though there is insufficient data to quantify these benefits at this time.

#### Comparison of Costs and Benefits

Corrosion is a natural process and occurs because of the tendency over time of metals to return to their original state. Maintenance and inspection records reveal that the presence of corrosion is more prevalent and pervasive in older aircraft. Based upon an independent risk analysis of over 1,500 National Transportation Safety Board accidents and conservative risk assessment results in a forecast of a range between 25 to 50 corrosion-induced accidents over a twenty-year period, with a present value benefit between \$72.5 million and \$145 million. The safety benefits of averting these accidents justify the costs of the proposed rule.

The FAA does not intend to wait for a series of accidents to provide justification for this proposed rule. The FAA needs the assurance of the corrosion prevention and control program to assure the continued airworthiness of the affected fleet. With this program in place the industry avoids unplanned inspections and maintenance resulting from corrosion-related accidents and benefits by an extended aircraft service life.

This proposed rule would extend to a significant number of airplanes the corrosion prevention and control program found to be necessary for in-service commercial jet airplanes based on studies following the Aloha Boeing 737 accident. Based on the analysis contained herein, the FAA concludes that the benefits of this proposed rule justify the costs.

#### IV. Initial Regulatory Flexibility Analysis

The Regulatory Flexibility Act of 1980 establishes "as a principle of regulatory issuance that agencies shall endeavor, consistent with the objective of the rule and of applicable statutes, to fit regulatory and informational requirements to the scale of the business, organizations, and governmental jurisdictions subject to regulation." To achieve that principle, the Act requires agencies to solicit and consider flexible regulatory proposals and to explain the rationale for their actions. The Act covers a wide range of small entities, including small businesses, not-for-profit organizations, and small governmental jurisdictions.

Agencies must perform a review to determine whether a proposed or final rule will have a significant economic impact on a substantial number of small entities. If the determination finds that it will, the agency must prepare a regulatory flexibility analysis (RFA) as described in the Act.

However, if an agency determines that a proposed or final rule is not expected to have a significant economic impact on a substantial number of small entities, section 605(b) of the 1980 act provides that the head of the agency may so certify, and an RFA is not required. The certification must include a statement providing the factual basis for this determination, and the reasoning should be clear.

Recently, the Office of Advocacy of the Small Business Administration (SBA) published new guidance for Federal agencies in responding to the requirements of the Regulatory Flexibility Act, as amended. Application of that guidance to this proposed rule indicates that it would have a significant impact on a substantial number of small entities. Accordingly, a full regulatory flexibility analysis was conducted and is summarized as follows.

1. A description of the reasons why action by the agency is being considered.

This action is being considered in order to control airplane structural material loss and the detrimental effects of corrosion because existing maintenance or inspection programs may not provide comprehensive, systematic corrosion prevention and control.

2. A succinct statement of the objectives of, and legal basis for, the proposed rule.

The objective of the proposed rule is to ensure the continuing airworthiness of aging airplanes operating in air transportation by requiring all airplanes operated under part 121, all U.S. registered airplanes used in scheduled passenger carrying operations under part 129, and all multiengine airplanes used in scheduled passenger carrying operations conducted under part 135, to include a Federal Aviation Administration (FAA) approved corrosion prevention and control program (CPCP) in the airplane's maintenance or inspection program.

This proposal represents a critical step toward compliance with the Aging Aircraft Safety Act of 1991. In October of 1991, Congress enacted Title IV of Public Law 102 143, the "Aging Aircraft Safety Act of 1991," to address aging aircraft concerns. The act was subsequently recodified as 49 U.S.C. 44717. Section 44717 of Title 49 instructs the Administrator to "prescribe regulations that ensure the continuing airworthiness of aging aircraft."

3. A description of the projected reporting, recordkeeping and other compliance requirements of the proposed rule, including an estimate of the classes or types of small entities that will be subject to the requirement and the type of professional skills necessary for preparation of the report or record.

The proposed rule would not impose any incremental record keeping authority. Existing 14 CFR 43, in part, already prescribes the content, form, and disposition of maintenance, preventive maintenance, rebuilding, and alteration records for any aircraft having a U.S. airworthiness certificate or any foreign registered aircraft used in common carriage under parts 121 or 135. The FAA recognizes, however, that the proposed rule would necessitate additional maintenance work, and consequently, would

also require that the additional record keeping associated with that work also be performed.

The FAA estimates that each hour of actual inspection and maintenance conducted under the proposal would require an additional 20 percent of an hour (12 minutes) for reporting and record keeping. This record keeping would be performed by the holder of an FAA approved repairman or maintenance certificate. The projected record keeping and reporting costs of the proposal are included as part of the overall costs computed in the evaluation and included below in the Regulatory Flexibility Cost Analysis.

4. An identification, to the extent practicable, of all relevant federal rules that may duplicate, overlap, or conflict with the proposed rule.

The FAA is unaware of any federal rules that would duplicate, overlap, or conflict with the proposed rule.

5. A description and an estimate of the number of small entities to which the proposed rule would apply.

The proposed rule would apply to the operators of all airplanes operated under 14 CFR part 121, all U.S. registered multiengine airplanes operated under 14 CFR part 129, and all multiengine airplanes used in scheduled operations under 14 CFR part 135. Standard industrial classification coding does not exactly coincide with the subsets of operators who could be affected by the proposed rule. Nevertheless, the following distributions of employment size and estimated receipts per employee for all scheduled air transportation firms (SIC Code 4512) are representative of the operators who would be affected by the proposed rule.

| <u>EMPLOYMENT</u><br><u>CATEGORY</u> | <u>NUMBER</u><br><u>OF FIRMS</u> | <u>ESTIMATED</u><br><u>RECEIPTS PER</u><br><u>EMPLOYEE</u> |
|--------------------------------------|----------------------------------|--|
| 0 - 4                                | 137                              | \$611,695  |
| 5 - 9                                | 45                               | \$510,555  |
| 10 - 19                              | 52                               | \$299,123  |
| 20 - 99                              | 112                              | \$264,065  |
| 100 - 499                            | 78                               | \$232,666  |
| <u>500+</u>                          | <u>70</u>                        | <u>\$252,334</u>   |
| TOTALS                               | 494                              | \$252,214  |

Based on existing operator/airplane distributions, the FAA estimates that 210 operators would be subject to the rule and approximately 132 would actually incur costs.<sup>4</sup> The agency has also estimated the numbers of subject and affected airplanes that each operator uses and has categorized the operators by fleet size in the following table.

| <u>OPERATOR</u><br><u>CATEGORY</u><br><u>(AIRPLANES)</u> | <u>COUNT OF OPERATORS</u>        |                                   |
|--|----------------------------------|-----------------------------------|
|  | <u>SUBJECT</u><br><u>TO RULE</u> | <u>AFFECTED</u><br><u>BY RULE</u> |
| 1 - 10   | 119                              | 84                                |
| 11 - 20  | 37                               | 16                                |
| 21 - 30  | 12                               | 4                                 |
| 31 - 40  | 8                                | 6                                 |
| 41 - 50  | 4                                | 4                                 |
| 51 AND UP  | <u>30</u>                        | <u>18</u>                         |
|  | 210                              | 132                               |

#### 6. Regulatory Flexibility Cost Analysis

The proposed rule would affect certain existing and future production aircraft, and it would also apply to new model airplanes intended for use in scheduled service. This Regulatory Flexibility Cost Analysis focuses on the first of these two categories because: (1) that impact represents almost 99 percent of the evaluated costs

---

<sup>4</sup> The remaining operators use airplane models that would be subject to the proposed rule but are already in full compliance.

of the proposed rule, and (2) it is possible to make some estimate of the distributional impact of these costs based on the existing operator fleet composition.

Table 3 in the Appendix details the computations used to estimate the annualized costs of the proposal per airplane, by model. Column A in Table 3 lists each airplane model and Column B details the estimated counts of the airplanes in each model that would be subject to the proposed rule. As noted in the evaluation, an estimated 7,108 airplanes would be subject to this major provision. These airplanes are included within the regulatory scope of the proposal but the vast majority would be unaffected because they already comply with the proposal. Column C, by comparison, shows the projected counts of those airplanes that would actually be affected; where incremental work would be accomplished and incremental expenses incurred. This column sums to a projected 2,901 airplanes. Column D contains the present value of the projected cost of the major proposal to industry, by airplane model, as computed in the regulatory evaluation and shown previously as Column AG of Table 1 in the Appendix. The present value estimated cost of this provision totals \$80.0 million.

Column E of Table 3 divides the cost-per-model data in Column D by the numbers of affected airplanes per model in Column C to produce the expected present value cost of the proposal per affected airplane. It is useful to consider the annualized equivalent of these costs; that is to say, the annual future payments that would be necessary to equal the present value costs for each model. Such payments are a function of: (1) the assumed interest rate, and (2) the time period over which the future payments would be borne. Consistent with the discount factor, this evaluation applies a 7 percent interest rate. As for the time period, the evaluation assesses costs over a 20-year time period, and this analysis assumes that, on average, the CPCP development and implementation costs would be borne over that period. Based on these two assumptions, the annualized cost of the CPCP would range between \$484 and \$30,170 per airplane (for those airplanes that would actually be affected.)

Next, the annualized cost estimates, by model, *per affected airplane*, from Table 3 were collated into the original evaluation

data set of operators and airplanes. Crosstabulations were performed and aggregated (see Table 4 in the Appendix) to project the expected annualized cost per operator. Table 4 includes all 210 of the estimated operators of airplanes that would be subject to the proposed rule, and projects that 132 would actually incur costs. The table includes counts, by operator, the number of airplanes that would be subject to (within the scope of) the proposed rule, and the numbers of airplanes that would actually be affected by the proposal. The data in these calculations are summarized in the table below which shows the average annualized impact per operator; where the operator classifications are grouped both by: (1) the number of all airplanes that the operator uses, and (2) the number of each operator's airplanes that would actually be affected by the proposal.

AVERAGE ANNUALIZED IMPACT PER OPERATOR

| COUNT OF<br>AIRPLANES<br><u>OPERATED</u> | AVERAGE<br>ANNUALIZED<br>IMPACT | COUNT OF<br>AIRPLANES<br><u>AFFECTED</u> | AVERAGE<br>ANNUALIZED<br>IMPACT |
|--|---------------------------------|--|---------------------------------|
| 1-10                                     | \$7,318                         | 1-10                                     | \$14,057                        |
| 11-20                                    | \$17,551                        | 11-20                                    | \$46,479                        |
| 21-30                                    | \$30,711                        | 21-30                                    | \$72,326                        |
| 31-40                                    | \$53,838                        | 31-40                                    | \$104,708                       |
| 41-50                                    | \$64,359                        | 41-50                                    | \$55,789                        |
| 51-60                                    | \$90,769                        | 51-60                                    | \$196,433                       |
| 61-70                                    | \$191,587                       | 61-70                                    | \$195,857                       |
| 71-80                                    | \$144,698                       | 71-80                                    | \$185,253                       |
| 81-90                                    | \$111,116                       | 81-90                                    | \$111,116                       |
| 91-100                                   | \$92,093                        | 91-100                                   | \$112,023                       |
| 100 Plus                                 | \$217,054                       | 100 Plus                                 | \$460,822                       |

7. Affordability Analysis and Disproportionality Analysis

As a measure of the affordability of the proposal, the table below shows a distribution of the projected annualized impacts of the proposed rule as a percentage of operator annual receipts. Operator receipt levels were estimated assuming: (1) the average of \$252,214 annual receipts per employee for SIC Code 4512 operators, described above in Paragraph 5, and (2) an example factor of 5 employees per airplane operated. (This factor varies widely across

operators.) The affordability statistic was then calculated for each of the 210 subject operators as the projected annualized cost of the rule for that operator divided by the product of \$252,214 times 5 employees per airplane times the number of airplanes operated. Under these assumptions, the expected annualized cost of the proposal for 209 of the 210 operators falls below 0.6 percent of their respective estimated annualized receipts. For one operator, costs would total 1.38 percent of estimated receipts.

The table can also be used to gauge the disproportionality of the proposed rule's relative burden. The percentage impact calculations are shown for three sizes of operators, depending on the numbers of airplanes that they operate. The calculations show a minor disproportionate impact on smaller operators who are slightly under-represented in the lowest "percentage impact" categories, and correspondingly, slightly over-represented in the higher impact categories.

COUNT OF OPERATORS BY  
PERCENTAGE IMPACT AND BY OPERATOR SIZE

| PERCENTAGE<br>IMPACT | AIRPLANES OPERATED |       |       | Total |
|----------------------|--------------------|-------|-------|-------|
|                      | 1-10               | 11-50 | 51 +  |       |
| 0% - .1%             | 68                 | 38    | 19    | 125   |
| .1% - .2%            | 10                 | 10    | 6     | 26    |
| .2% - .3%            | 15                 | 4     | 2     | 21    |
| .3% - .4%            | 16                 | 7     | 3     | 26    |
| .4% - .5%            | 8                  | 2     | 0     | 10    |
| .5% - .6%            | 1                  | 0     | 0     | 1     |
| -----                | --0--              | --0-- | --0-- | --0-- |
| 1.3% - 1.4%          | 1                  | 0     | 0     | 1     |
| Total                | 119                | 61    | 30    | 210   |

## 8. Business Closure Analysis

The FAA feels that the annualized average impact of the rule as a function of an affected firm's average annual receipts is low. The agency recognizes, and this evaluation has described, that the potential impact for some operators may be above average and may not be distributed evenly over time. The cost methodology for this evaluation further addresses the fact that it may not be economical to develop and implement a corrosion prevention and control program for some older airplane models with few subject airplanes. The evaluation estimated that program costs would be prohibitive for 11 airplane models, and included a 50 percent reduction of fleet resale value as an estimated cost attributable to the rule.

## 9. Competitiveness Analysis

No quantitative estimate of the proposed rule's potential impact on small business competitiveness has been made. However, the FAA feels that the findings from the Affordability Analysis and the Disproportionality Analysis above support the argument that the proposed rule will not seriously impede small entity competitiveness.

## 10. Description of Alternatives

The FAA has considered several approaches to this proposed rulemaking and has attempted to minimize the potential economic impact of the proposal, especially the impact on the operation of aircraft most likely to be used by small entities. The principal alternative would be to take no new rulemaking action and to rely on the existing corrosion related requirements in parts 23 and 25. The FAA has determined that these existing requirements have not always resulted in a comprehensive and systematic corrosion prevention and control program for either transport, commuter, or small category airplanes. In addition, the FAA has determined that such inaction would not respond to the provisions of 49 U.S.C. 44717, which requires the Administrator to prescribe regulations that ensure the continuing airworthiness of aging aircraft.

A second alternative would be to omit all small aircraft from the proposal since there is an identifiable correlation between

smaller firms and smaller aircraft. Again, the FAA opposes this alternative since it would leave the existing problem for a significant segment of the scheduled passenger industry and would create an unacceptable safety inequity.

As proposed, this rulemaking would apply to all airplanes operated under part 121, all U.S. registered multiengine airplanes operated under part 129, and all multiengine airplanes used in scheduled operations under part 135. The proposed rule would not include helicopters, single-engine airplanes operated under part 135 or part 129, airplanes used in cargo operations under part 135, or airplanes used in unscheduled (on-demand) operations under part 135.

The aircraft and operations omitted from this proposal are not exclusively operated by small entities, but the FAA holds that the excluded airplane categories are more likely to be operated by small entities than, for example, large transport category airplanes would be. As noted above, the proposed rule would actually affect some 2,900 airplanes. By comparison, the exclusions described here, taken together, remove an estimated 5,023 additional aircraft from the proposal. This includes, with overlap, 1,441 helicopters; 4,663 aircraft used in on-demand operations; and 1,812 single-engine aircraft.

The FAA specifically requests comments regarding the exclusion of such aircraft operations from this proposed rule.

#### 11. Compliance Assistance

In its efforts to assist small entities and other affected parties in complying with the proposed rule, the FAA is publishing an advisory circular, "Development of Corrosion Prevention and Control Programs." A notice of availability for this circular will be published concurrently with the proposed rule. This circular details acceptable means of compliance with the proposed rule.

Additionally, the FAA has developed a CPCP for a generic, civil, twin-engine aircraft and will make this document available as part of the appendix to the advisory circular accompanying the

proposed rule. This document can serve as a core framework for the baseline program for defining the corrosion prevention and control requirements for a subject airplane model based on the average operating profile and operating environment. This generic CPCP model would be particularly useful to small operators in the event that the type certificate holder for a given model is not available to develop the CPCP for that model.

#### International Trade Impact Assessment

The Trade Agreement Act of 1979 prohibits Federal agencies from engaging in any standards or related activities that create unnecessary obstacles to the foreign commerce of the United States. Legitimate domestic objectives, such as safety, are not considered unnecessary obstacles. The statute also requires consideration of international standards and where appropriate, that they be the basis for U.S. standards.

In accordance with the above statute, the FAA has assessed the potential effect of this proposed rule and has determined that the objective of the rule is to maintain the current level of safety. In addition, the rule would have only a domestic impact and therefore create no obstacles to the foreign commerce of the United States.

#### Unfunded Mandates Assessment

Title II of the Unfunded Mandates Reform Act of 1995 (the Act), enacted as Pub. L. 104-4 on March 22, 1995, requires each Federal agency, to the extent permitted by law, to prepare a written assessment of the effects of any Federal mandate in a proposed or final agency rule that may result in the expenditure by State, local, and tribal governments, in the aggregate, or by the private sector, of \$100 million or more (adjusted annually for inflation) in any one year. Section 204(a) of the Act, 2 U.S.C. 1534(a), requires the Federal agency to develop an effective process to permit timely input by elected officers (or their designees) of State, local, and tribal governments on a proposed "significant intergovernmental mandate." A "significant intergovernmental mandate" under the Act is any provision in a

Federal agency regulation that will impose an enforceable duty upon State, local, and tribal governments, in the aggregate, of \$100 million (adjusted annually for inflation) in any one year. Section 203 of the Act, 2 U.S.C. 1533, which supplements section 204(a), provides that before establishing any regulatory requirements that might significantly or uniquely affect small governments, the agency shall have developed a plan that, among other things, provides for notice to potentially affected small governments, if any, and for a meaningful and timely opportunity to provide input in the development of regulatory proposals.

The FAA determines that this proposed rule would not contain a significant intergovernmental or private sector mandate as defined by the Act.
