

This summer, my 28 year old son, Brett Stone, died of apparent heart failure while aboard a Frontier flight from Boston to San Francisco. He was athletic, ate properly, and had no history of heart disease. A doctor & EMT aboard the flight began CPR within seconds of his stopping breathing. After checking his pulse, these medical experts requested an AED. This AED would have made a difference. I know Brett would be alive today, had one been aboard his flight. How can we ignore this need?
