

In 393.104(b) visible damage is said to include but not be limited to, cracks, cuts, & deformation. For webbing is there going to be a minimum aggregate width before it is in violation of th FMCSR's or is any cut going to be a violation. i.e. a 1/16 or 1/8 in. cut. If any cut is a violation, then a large number of webbing securement devices will only have a one use life span.

Any further definition of what or when a load securment device becomes damaged will greatly help with uniform enforcement throughout the US.
