

Well while sounding like a good idea it also sounds like a good idea. In this article I read that it could only track 3 tires at one time, and the last time I checked most motor vehicles had ran with 4 tires. So what I am saying is that what about the 4th tire? if its not being monitored what would happen if that tire was low? how would you know or find out? and will it really save that much more money? and if it does then how did you get your resource? thanks for taking the time to read this. please respond if you could with your answers. thanks!
