

This comment is in complaint to the proposed legislation to install mandatory tire pressure monitors in vehicles.

A tire, well maintained, poses absolutely no hazards. Other regulations are for safety of passengers in a crash. This regulation is for preventative maintenance of such rare occurance that it's almost a laughable matter.

Where is such legislation leading us? Next we'll have to have sensors in the transmission fluid so we don't get stuck somewhere in a potentially dangerous situation. Monitors in the differential. Monitors in the headlights (doesn't matter that you can tell when a headlight went out, like you can see a tire bulging when low - we need them to be federally mandated!).

Please. You're talking about spending a billion a year (fuel savings is an afterthought, not an initial investment, and does not lead back to the automotive industry). How about spending that in better education that tires, like the rest of the car, need to be taken care of?
