

re: Headlight glare 1. It's a problem with high-mounted headlights on trucks and SUV's behind you. Even though they have low beam headlights and proper aiming, the lights reflect off your mirrors and are annoying and distracting. A solution would be to mandate that headlights not be allowed to be mounted above a certain height, such as 36 inches. 2. High intensity discharge lights on oncoming traffic really do cause more glare in the eyes of drivers. It's a real problem. 3. Silly blue headlights don't cause much of a problem to other drivers. 4. Fog lights are OK if properly adjusted, but many are not adjusted right. Is there a standard? 5. Auxiliary high beams are sometimes a problem. Are there standards?
