

Kimberly-Clark Corporation is FAR 91 operator of a Gulfstream V equipped with an Enhanced Vision system. Use of the system has raised our level of safety both during ground operations under low visibility and during approaches. The change to part 91.175 simplifying the determination of proper visual requirements for landing would allow a reliable and much better coordinated handling of the few seconds just before landing by the flight crew. This would contribute to enhanced safety of operation during this critical phase of flight. We have invested in this technology for our present aircraft, and we are considering adding other aircraft to the fleet that would be able to be equipped with the same or similar equipment. Our flight operations take us to many different parts of the world. This equipment is a giant leap toward increased safety.
