

My husband has pulmonary fibrosis and must use oxygen 24/7. He also must travel from time to time by air for his work and also for certain medical evaluations. It is very difficult and costly for him to arrange for oxygen use since he is not allowed to use his own equipment. Recently we flew on a small plane that did not accommodate his O2 needs so he flew without aid of oxygen. Please consider allowing passengers to use their oxygen within the guidelines of the prescribing physician. It is vital for the health of many passengers. Doesn't the ADA cover this?
