

As an oxygen user I feel the FAA needs to rethink the use of oxygen aboard passenger planes. New machinery, such as the Inogen One, could give freedom to those of us who have been limited to travel by auto, bus, ship or train. All these methods of travel are wonderful but require more time and many more planning than hopping on a plane. Though some airlines now sell oxygen, anyone I know who has tried a trip has found making connections a very anxiety filled task.

Today's oxygen users are not on their last legs, many of us have lots of good "mileage" left in us. Please, give us the same consideration as people with other special needs. Inogen One may open the world again for me and others like me. I have relative on the other side of the continent I want to visit and a new great grandson to hold. This unit would give me the freedom I am starved for now. Remember Inogen One is 21st century thinking. Let's do it.

Thank you for listening. Jo Swan
