

Adding cost and complexity to new vehicles in order to reduce the responsibility of a motor vehicle operator is not the answer. I firmly believe that too much is being done to isolate the driver from the driving experience. Perhaps, if manufacturers were mandated to provide an analog or digital tire pressure gauge with every new vehicle, operators would take the opportunity to inspect their tires for proper inflation and overall condition. If they elect not to, then the burden is placed solely on the operator, and not the manufacturer. People need to put down their cell phones, and get back into the business of paying attention to all aspects of their vehicles, and road and traffic conditions!
