

Hi, my name is Ron Britton. I believe I might have the solution to your problem. Back in 1998 I developed something called the T-Lite 2000. Its primary adjective was to alert the driver when the air pressure in his/her car was lower than it should be. My main concern was the safety of women and children. There are few women I know who can change a flat tire or even desire to put air in the tire. The T-Lite 2000 has two modes, flash and light. The light mode is designed to illuminate the area around the tire and under the wheel well to facilitate the process of changing the tire. The flash mode is designed to alert the driver that the air pressure has went below a certain level. I suggest putting a leveling device on car will help to determine when the change of air pressure has taken place. The low tire warning light leveler will greatly enhance the safty of both the passeners and vehicle. I believe that this devise will save lives, cut down fatalities as well as insurance cost nationally. If you want to know more about the T-Lite 2000, you can reach me at (574) 273-9360 or E-mail me at Britton415@hotmail.com. Thank you. I look forward to hearing from you.
