

The current ID system is working and the responders are familiar with it. While the new proposal sounds good on paper to emergency responders it could spell disaster. If responders have access to the contents code etc. a terrorist can end up with the same information. The idea is to protect the public and responders and a delay in knowing what the contents are can delay protection. This is a wrong road to change the system. Color coding can make a target more obvious. We urge you to keep the system that works in the interest of public safety. Could the funds be better spent to change the routes of the substances away from as many targets as possible?
